Problem still is termiology. Reminds me of the "How many bits are there in a
word" debate.

The people that make disks/disk controllers used to classify density in bits
per inch and never sector lenght or sectors per track. Their definition was
always FM/Single density MFM/Double Density. They even listed some of the
formats there hardware would support, thing like single density, 512 bytes
per sector, 4 sectors per track.

IMO: It only got its popular meaning after 360k 512 byte per sector IBM
style format became widely available, then everyone thought double density
must mean 180k per side. If we were consistant with clasifying disks by
sector lenght, they we would have to call IBMs quad density or something
because they use 512 byte sectors to our 256.

But then quad density drives on IBM refered to 80 tracks vs 40 tracks of MFM
data, so we end up with another misnomer and even the IBM types were
deviating from their own standards a bit.

But I know what you mean.

I had a similar problem, but I don't think it was only XF551 drives that
were affected.

Sometimes you put a really old disk in a drive and wind up with heads full
of oxide. The stuff just flakes off the disk onto the heads. But cleaning
the heads is all that's needed to fix the problem.

It sometimes pays to touch the oxide on a disk, carefully, to see if the
stuff will flake off.

At one time, local wharehouses were selling pallets new of 1031s for $1 each
and 1010 tape drives 2/$5 so you may want to do a search with them as a
keyword. Lots of surplus shops have their inventory on the web.

When it comes to the schematics to the SIO2ST (SIO2PC same thing) you can get a good description on the Ape interface page that Steve Tucker set up. If you need that, just say the word. .

Hehehe... when it comes to Gemulator, why would you want to mess with a SIO2ST cable to begin with? But if you have cable to hook to say a external drive, then you could hook the cable through that and then the other to the ST/Falcon.

FAT means File Alacation Table. 1 (or more) sectors are used for the
link table. For each CLUSTER, there is 1(?) byte. Some numbers have
special meaning.

ie deleated, bad, EOF, etc. I am not sure if dos 3 had 8bit or 16 bit
FAT or if special numbers are used. I didn't look all that hard.

This is not quite fair, even though I never used and never liked Dos 3.0.

First, the help key could be replaced by the Atari (Inverse) key, it should
work the same way.
Second, it's definitely not slow. Deleting a file on Dos 3 takes only a second,
whereas Dos 2 has really to trace the whole file to delete it.

As I said, not that I ever liked it, but let's keep this straight.

So long,
Thomas

Please check my posting above, it includes a rough description how the
story works.

>One thing I've always wondered about is how were sectors/blocks linked
>together. Given that sectors were already clustered into blocks of 8,
>was there still a link from every sector to the next even within a
>block, or were blocks rather than sectors linked together, needing
>only one link for each 8 sectors.

No, neither. The data blocks aren't linked the way how Dos 2 links sectors.
The linkage and the sector allocation (i.e. the VTOC) are combined into one
thing, the FAT. One byte per block, this byte tells whether the block is
available (0x00) or used (<>0x00) and where to find the next block of the
file (block index) or if the file end has been reached (0xff, or something
like this). The file size in bytes was given in the directory, and was not
available from the FAT alone.

>The 2nd scheme would mean you could squeeze an extra few bytes into 8
>sectors than you could in 2.0/2.5, which might explain why it was done
>that way.

No, it uses the third scheme. (-; Absolutely no linkage bytes per sector at
all.

>However from what I can remember of experiments many
>years ago, each block only seemed to hold 1000 bytes of data, which
>suggests 125 byte sectors like 2.0/2.5.

No, I'm sorry, each block really holds precisely 1024 bytes.

>And then there's sectors
>1024-1040 which can't be used by a standard 2.5, but I guess 3.0 does
>actually use.

Yup.

>I guess what it boils down to is why cluster sectors into blocks of 8?
>There must have been some sort of reason for that, however twisted!

No, a very straight reason. (-; That made the FAT fit into one sector of
128 bytes. 8 * 128 = 1024, i.e. 1024 useable sectors per Dos 3 disk, the
remaining sectors are used for the directory and the FAT, and the boot code,
of course.

>DOS 3.0 is very wasteful for small or medium size files, but is it any
>better at big, disk sized files?

Yes, definitely. It would be much better on HDs, leaving alone the more
canonical file structure. POINT and NOTE how we know it under Dos 2.0 would
be a pain on a HD.

Ok, for today's standards FAT is not a very smart or secure filing system
either, but a Unix "ext2" for the 8 bits is, uhm, a bit overshooting as
well. (-;

I think there's no need to change my position: Dos 3 was in many ways an
improvement and a better solution, except that they forgot that compatibility
is a major issue, and that the waste of up to 7 sectors per file cannot be
tolerated for a storage medium as light-weighted as the 1050's. Nevertheless,
I never actually worked with the Dos 3. Back in that time I had no big idea how
a filing system should look like, or even what this thing is in first
place. (-;

>Or did Atari have plans to introduce
>bigger drives along with the later XL models that would have made the
>waste less of an issue?

I've no idea. Maybe?

>Or is it just because dividing/multiplying by
>1000 is easier for people than by 125? =)

Gee, I guess not. (-; It's harder for a computer. (-:

>
[snip]

Why not simply say it like that:
- Atari 810 & 1050 & other standard floppies have 19200 Baud
(lets call it single speed!)
- Atari XF551 has 19200 and 38400 Baud (thus single & double speed)
- real sector skewing drives (like Indus, Us-Doubler, Supermax,
german Turbo 1050, german Hyper-XF, etc.) have 19200, 38400 and
approx. 57600 Baud (thus single, double and triple speed)
- cache/track buffering drives (like Happy, Speedy and others) have
19200 Baud (slow/unhappy mode), approx. 38400 Baud (normal mode),
approx. 57600 Baud (emulated US-Doubler mode on Happy, emulated
Turbo 1050 mode on Speedy drives) and finally 76800 Baud with
ultraspeed (or in other words: single, double, triple and quad
speed !!).

Ok, this is not as exact as it could be, but it`s a good overview to
start with. One last thing: the Indus uses Sector skewing (no cache or
track buffering) but still gains 76800Baud ?? Maybe my overview is wrong
here, I thought sector skewing drives only reach triple speed / 57600
Baud... greetings - Andreas

And there was no bug or error in the zip file (so you had to use
PKZIPFIX or others) ?? Wow, what a compression method !!
But I think this program did not work in the compressed mode (it did not
uncompress itself), it had to be unzipped first. For the little Atari
this would not make any sense, since the uncompressed program would
never fit into its memory. What we would need is a good compressed MP3
program, that a) fits into 48 k memory and b) uncompresses itself in
such a way, that it works/plays on the system without any crashes... I
do not believe thats possible - at least not today (maybe tomorrow, who
knows). - Andreas

Yeah, its great to get the Scott Adams games on cartridge format soon.
But afaik Rally Speedway was already avaiable on cart (I have it !!).
Will there also be games from Adventure International (like Preppie,
Preppie II and many others) and SAGA ?? I loved these Scott Adams
Adventures (especially the graphic versions and comic versions like
Spiderman, Hulk, Fantastic Four, but they surely take to much
memory). - Andreas

Ok, so lets ask some questions. The XLDJ uses its very own format (since it is an older program). Is there any converter avaiable, that converts the .DJ images to ATR or XFD standard (and vice versa) ?? Thats the problem for most Atari ST/STE/TT/Falcon users, they can use the DJ but no ATR/XFD images and PC users cannot use their DJ images... Besides, a friend of mine uses the DJ with his TT, another one with ST and STE and a third one with the Falcon, so it is working on all these machines (ok, the Falcon and maybe the TT need a little modification). - andreas magenheimer

That sounds great to me, but alas I have not seen any undelete program
for MyDOS (and Atari DOS 2.0 or 2.5 undelete does not work here). Do you
have any sorter program for MyDOS, so one can use the above mentioned
sorting advantages ?!? Hey, it would be great if the 8-Bit Atari world
would only consist of two continents: MyDOS and SpartaDOS. That would
mean much less problems... - Andreas

Yes, there are some tools, but they are all drive dependant, which means
with some PC drives and this software you can read medium/dual density,
with some drives you cannot. One program I know of, is from ABBUC member
Joerg Gernreich, it appeared on ABBUC magazine. So go and ask Wolfgang
Burger for it. Another program is Deana (or so), where the manual
mentions it could also read dual density. Never tested any of these two
programs... (I prefer using SIO2PC hard+software with original Atari and
original Atari floppy.)

Maybe we should cooperate in an Atari-Elite interest group and spent some thousand dollars for the guy programming and converting it for the little Atari. Lets think of 100 users, where eveyone spends 100 dollars, thats a total of 10thousand dollars. Enough for a programmer to do it - or not ?? - Andreas magenheimer

P.S. But who has/can support any source codes for Elite ??

Speaking of SpartaDOS and disk formats, I had some info from this NG on
the sparta disk format, which I lost in an HD problem a while back.
Anybody got info on it handy?

Hmmm... you've given me something to look into. I have been converting
files from ATR format to the strange DI format of the 800XLDJ in recent times
(thanks of course to ATR utilities on the Atari8.) Give me something to do to
attempt making an ATR file from the Atari8.

Infocom games shouldn't be that difficult to archieve, since they didn't
have any copy protection.

Frequency Modulation and Modified Frequency Modulation.

I'm not that familiar with the terms myself, but my understanding of it is
AM Amplitude Modulation for comparison uses signal strenght to encode level.
FM uses fixed amplitude signal with variable frequency to encode data, and
frequency to level to decode it. I have some really old references where
they just us a 4046 phase locked loop chip to do this decoding.

Modified FM, no clue<grin>. I have very old refs that explain very old
terms, and very new refs that take definitions for granted, but very little
in between.

Don't laugh, FM really stands for the same thing, "frequency modulation". (-;
MFM is "modified frequency modulation". MFM encoding writes actually two
bits to the surface for one data bit in a way such that no more than three
zero bits or a single one bit can follow each other. That is,

1 1 0 0 1 0 1 0 would be MFM encoded as
1010010 0 1000100

If you analyze this from a mathematical point of view, this is in many ways
a frequency modulation with the double frequency of the data clock rate.

So long,
Thomas

Undeleting with MYDOS is really easy: change the status byte in the
directory to show the file as normal. That will, of course, screw up the
VTOC and free sector count but VTOCFIX can fix that for you easily.

I've never bothered writing a sort for MYDOS as I don't use it often
enough to make it worth the effort. For files in the root directory,
you could probably sort with TopDOS. In any case, it's very easy to write
a sort for MYDOS: you simply read in the directory and rearrange the
entries as you wish--BUT you must make sure you're doing this on a
MYDOS format disk. MYDOS, in straight single and double density modes,
emulates DOS 2.0 nearly exactly i.e. file numbers are used in the
links so you can't sort the directory. I'd have to do some digging into
the source code but I think MYDOS makes the file number/no file number
decision based on the first byte in the VTOC ($02 = DOS 2, $03+ = MYDOS).

The SpartaDOS manual has been posted on-line. You might try Tom Hunt's
ftp site. I have a copy somewhere on my HD that I'm working on as I get
time (updating it with the 3.2 stuff included with the RT8 release and
some info of my own).

essentially:

sectors 1-3: boot loader code and DOS disk data tables (first 40 bytes)
sectors 4-x: bit map sectors i.e. the VTOC, number of sectors depends on
disk size and density
sector x+1: first map of the MAIN directory
sector x+2: first directory data sector

With SD, DD, and QD there will only be one bit map, with ED there will be
two.

As (deleted the message too quickly) I think Rick said:
(Modified) Frequency Modulation. The major difference from the user point
of view is that the MFM data transfer rate is double that of FM. So,
1050's actually read and write faster in ED than they do in SD.

You can actually notice the speed difference in SpartaDOS.

TopDOS 1.5 provides a sort directory and an undelete file capability in double or single density along with batch files and RAM access/alteration. It can't sort 2.0/2.5 because of the file number limk but should do MyDOS.

Source record: 44683

Hi,

>P.S. But who has/can support any source codes for Elite ??

I've reverse engineered a high percentage of the C64 version,
and had some help from Ian Bell and Christian Pinder who
is converting the BBC version into C on the PC.
(see www.newkind.co.uk).

Aside from getting married 6 months ago, normal working pressures,
2 evenings a week consultancy, working on the re-port of CC65 back
to the Atari 8-bit and a Linux port to 68000 Atari STs, I might get a free
stretch to start porting the code over!

Also, I'm in the process of selling my flat and buying a new house!
Once I'm settled in I'll have a whole room just for computing :-)

Having an 8-bit Atari Elite is a nagging itch that I've had since playing
the Atari ST version (and the C64 version later) over 10 years ago!

Maybe by Christmas... but don't quote me!

Regards,

Mark.

hi andreas,
we are working on whomper stomper,preppie I&II.
i also would like to see some graphic advntures done,and we are looking
at some right now.
rally speedway was not a real big ditributed cart here,i only had it
once in my place,then i could get it no more.
i always liked the game,and thought that it was way ahead of its time,
and there is not much else on cart race car wise except pole
position,and pitstop.
so i started with that one.thanks,
lance

To take advantage of Discounts or FREE Monitors or FREE Jaguar Video
Cable, you must E-Mail me to Claim it & state what you want in E-Mail.

Discounts! Buy now! 5% Discount with a $50 Purchase. 10% Discount with
a $100 Purchase. 15% Discount with a $150 Purchase. And a 20% Discount
with a $200 Purchase. Discounts Apply to Classic Atari 8 Bit, Atari ST
and/or Atari Jaguar. Hardware, Software, Books & Accessories! Shipping
not figured into Discount. Customer pays Shipping. Limited Time offer!
Substitutions considered.

FREE Monitor with Atari Purchase! Buy either an Atari 1040STF, Mega 2
ST or a 1040STe and receive a FREE Monitor. Your Choice of a Color or
MonoChrome Monitor. FREE Monitor when purchasing an Atari 8 Bit
Computer. Buy an Atari 800XL or an Atari 130XE and an Atari 8 Bit Disk
Drive such as an Atari 1050 Drive & receive your choice of any Monitor
in the Atari 8 Bit Hardware Catalog. And FREE when purchasing $50 of
Atari Jaguar items, receive absolutely FREE, a +NEW in BAG Jaguar
Composite Video/Stereo Audio Cable. Offer Available for Limited Time
only. First Come, First Serve! Subject due to availability! Customer
pays all Shipping! Substitutions considered.

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out
into Atari Jaguar Hardware & Games. So checkout what's new on my Web
Site. In Fact, check it regularly as my Catalogs are updated regularly.
Customer's are served, first come, first serve! No competing in
auctions. Just Sales, Support & Service! I have 8 different Catalogs, &
my SoftWare Catalogs are my largest. They have the biggest Byte Count.
You should see my inventory! I have TruckLoads of HardWare, Boxes and
Boxes of Software & Libraries of Books & Reference Material for the
Classic Atari 8 Bit, Atari ST & Atari Jaguar Game Machine! And
remember, if you can't come see me today, come see me tomorrow!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump

to my FTP site linked to my WebSite so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor & view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend.

Hmm. Wonder if the SIO2ST would work with the "Gemulator"? Anyone ever looked into that? I'm sure that it would "kick it down a notch" (to paraphrase the guy on the Food Channel), but since PC's run so very fast relative to an ST, and the Gemulator is a very, very good emulator...
Larry

Easier said than done, and the results likely wouldn't be all that
satisfactory. C is a poor match for the 6502, and C runtime libraries
are very hard to fit in the available RAM.

Hi,

>Is it available?

No, I've only completed most of the reverse engineering,
i.e. coming to understand what's doing what. I'm just
getting into the 3D math but have the main game
features and variables/structures identified.

I haven't started writing any code on the Atari yet!

> Is the vector graphics (which graphics mode) faster than the
>C64-based? I think it should be faster because of higher CPU clock
>and linear video RAM adressing.

We'll have to wait and see!

>Then it should be possible to make a cross compilation from C
> to Atari-opcode or am I wrong?

It wouldn't be fast enough. Christian had written the 3D stuff
using floating point vectors wheras the 6502 code is very optimised!
I wrote a fixed point library to test the speed difference when
I ported the ship rotator onto the Palm Pilot, someone may want
to use this on the 8-bit.

>Have you ever thought about an open source project concerning ELITE?

I'd better check out the legalities of it first ;-)
But I have little worries about giving out the current disassembly
if anyone is seriously interested in beginning the port.

As for open source, the proposed 'Elite club' seems a little
way off but I think that it primarily deals with the games
AFTER Elite and the source code they will release probably
won't be the original Elite as Ian Bell already has the BBC
cassette sources on his site.

My idea for the Atari 8-bit version was to do away with the
basic buy/sell interface of the original versions and have a
graphical interface like the ST version. Agree/Disagree?
Also I'd like to add the Ship ID facility.

Regards,

Mark.

> approx. 57600 Baud (thus single, double and triple speed)

The xf uses sector skewing.
At least supermax and usd only have 19200 and 57600 baud. Big
difference is the command frame is sent at the high baud rate unlike
the xf and indus.
I am not aware of any other speeds used by both these upgrades. I have
dissembled both Supermax and USD. I can let people look at the usd
code is they want it. Supermax still belonges to me.
I have mananged to get both superarchiver and Happy roms as well.
Both where tricky in there own way.

> - cache/track buffering drives (like Happy, Speedy and others) have

> track buffering) but still gains 76800Baud ?? Maybe my overview is wrong
> here, I thought sector skewing drives only reach triple speed / 57600
> Baud... greetings - Andreas

from my tests, the indus sector skew is the same as the usd sector
skew.
The indus command frame is sent at 19200 baud with the high bit set.
The data frame is sent at 78000 baud (approx). The combined times of
both apperantly are about equal to both cammand and data sent at 57600
baud.

P.s. I got my baud rates from the clock out pin on the sio bus. I used a frequency counter.

I read somewhere that FM stores a databit, clockbit, databit, clockbit
etc (at least I think it was called a clockbit)
MFM does away with the clock bit so in affect, storing twice as much.

I acquired cartridges of Ballblazer and Rescue On Fractalus that have
the intros on EBay Germany this year. They are XE carts and work
perfectly on the 800XL/130XE. Both games are still up for auction
at ebay.de, they're in packaging and shrink-wrapped. I guess someone
found a container load of them somewhere. :)

> Mark Bedingfield

What you will want to do in this case is get your 800xl and hook it to a standard Atari floppy disk drive. Then from the floppy drive, connect the "SIO2ST" cable into the other I/O port, and then from there to the serial port on the ST/Falcon.

The important thing to keep in mind that 800XLDJ virtual drives work great unless you try setting a virtual drive for the same position as the real drive. The two will naturally conflict, so be careful not to do this. This really doesn't harm anything, but the computer will put up a major sputtering fit for a minute and eventually error out most of the time. :)

From the real drive you can copy them onto virtual drives and save them in the strange .DI format. From then on, you can load the disk from the XLDJ and give the real drive a rest.

Nope. My first experience with an Atari computer was when I got a 130XE
with a 1050 and DOS 3.0 at my local Service Merchandise. I kind of took
the fast deletes, appends, etc. for granted.

I switched back to 3.0 in a hurry after I used 2.5 a bit, then finally
switched to MyDOS after I bought a pair of XF551's a couple of years back.

Not sure how Ian Bell feels now - David Braburn started getting heavy (allegedly) last year on account of Ian Bell putting all the old versions of Elite on his web site for free.

I can't bid on it :(I'll pay 30DM (+ shipping) for that game... I want
it badly. (Rescue on Fractalus - although I would also pay that for
Ballblazer).

Would the german cartridge work on my PAL 65XE?

Plus, my C code was designed to be readable and portable so I
haven't worried about liberal use of Floating Point etc. You'd
be far better porting the 6502 code.

Christian.

Source record: 44507

FamilyNet HQ: Telnet:\\www.family-bbs.net

Well this is cute, my friend moved out of town, and when he did, knowing my love for vintage computing, he offered to give me his C-64. In honor to my friend, I accepted his C-64 into my home with open arms dispite the fact that I have considered the Commodore line a direct rival to the Atari for nearly two decades. :)

The computer sits amoungst my Atari8/ST setup rather well. I have a newer style C-64 (in the C-128 stylish case) and the newer 1541 drive. Most of the time I have them covered and unplugged until I want to tinker with them.

I showed my wife briefly the way the two parallel universes of computers.

The Atari 400/800 had no parallel to show, since they were set to compete with the Vic 20.
I set the Atari 800xl next to an older C-64.
Then I set the XEGS next to the newer cased (C-128 looking) C-64.

She thought it was cute.

But all and all, the feel of the system is much like the Atari, and seeing some of its games show to me games that could have just as likely been on the Atari system.

However, there are two things that come to mind when playing with it.
First off how cheap the system felt. Or I should say cheaply made. The keys when pressed do not give a key click to reassure you that a key has been hit.
And Atari users have been forever spoiled by the drive loading sound. You either like the drive loading sound or not (I do). Naturally, like any other computer, the C-64 does not have this, and EGAD that drive is slow!!!
Of course, I understand that there is a drive accelerator cartridge out there, so when a few more gadgets it could be descent.

I did get to see the differences in sound and graphics from loading Archon. The intro music had more voices, in that version the "ARCHON" bounces around at the top of the screen.

Similiar to the Macintosh version, the characters in Archon are surrounded with a strong black outline to their form. This might have been more of what the people at Freefall wanted, but honestly, maybe through bias and years of play on the Atari, I prefer my characters without such an outline.

Alas, considering the Atari8 was originally built in the days of the Vic-20 and continued competing with this computer of another generation of Commodore I have to say I'm impressed. I have fun every so often tinkering on the C-64 to see what could have been on the Atari.

Is it me, or was the C-64 slightly more of a game machine that the Atari?
I think the lack of a disk operating system makes me feel that way.

Anyway, here is my first impression of a C-64. Now if I can only figure
out how to work with the disk drive a little better through Commodore's basic.
(grin)

(Any disk operating system on the Atari has me spoiled here). Hmmm... any
chance of porting MyDos 4.5 to the C-64. ;)

Take a look at the DOS 3 (english) manual. It has some notices about the
1450XLD, but as far as I remember, only in that way, that you could use
Side A of a disk with the 1450XLD as drive 1 and side B of this disk
with the 1450XLD as drive 2... The floppy drive of the 1450XLD still
merely supported medium/dual density, but had to write heads... I am
not sure if you would have been 1050 compatible, if treating side b of a
disk like that (using the second write head). Nowadays I could do the
same with an XF551 floppy drive (and an alernative OS that I have
installed), but if I would format side B of a disk (S/M/D) without
flipping it over, just using the second write head, the 1050 would be
unable to read this disk side...

You can also patch DOS 2.0s in that way, it formats 931 free sectors (or
even up to 963 free sectors), but still uses one VTOC !! Alas, I am not
sure if this will give you FM or MFM... - Andreas

Source record: 44511

Hello James,
afaik, 1) the sector skewing drives need two things, to get full highspeed: highspeed-SIO (DOS, Gamedos, etc.) and sector skewing. If you do not use any of these two, you have 19200 Baud, with highspeed SIO only it should be approx. 38400 Baud, and finally with both highspeed SIO and sector skewing it should be approx. 57600 Baud... (by the way, using only sector skewing without highseed SIO will slow the drive down !! try a sector skewing disk on a normal 1050 it appears to work slower than 19200 Baud...)

2) the track/cache buffer drives need only highspeed SIO, they do not need/nor use sector skewing. Since they have an alternative OS (not original 1050, etc. OS) and RAM onboard they do not need sector skewing, but can be programmed to work like such a drive (US-Doubler-emulator for Happy avaiable and 1050 turbo emulator for Speedy avaiable)...

So my overview may look like this:

1) sector skewing drives
a) slow (no highspeed SIO, no sector skewing)
b) only highspeed SIO
c) both highspeed SIO and sector skewing
[d) only sector skewing (no highspeed SIO)]

2) track/cache buffer drives:
a) slow/unhappy mode
b) normal mode (no highspeed SIO)
c) emulated US doubler/Turbo 1050 (sector skewing) mode
d) with highspeed SIO

But finally, my overview should just make things easier, instead of speaking of dozens of different drives, (high)speed modes and Baudrates, we could just speak of 4 different speeds:
- single speed: 19200 Baud
- double speed: 38400 Baud
- triple speed: 57600 Baud
- quad speed: 76800 Baud

Thats all. - Andreas Magenheimer

There are two ways to do it:

- Get an interface box that goes between the A8 and the VGA monitor (I forget the common name for them)

- Get a video card with Composite Video In for your PC. That way, you can have the Atari display on your PC screen (either windowed or full screen) plus your copy of APE98.

I always loathed my C64 friend. Hated his slow drives, didn't like
the fixed 16 colour graphics... :-)

[...]
> But all and all, the feel of the system is much like the Atari, and
>seeing some of its games show to me games that could have just as likely been
>on the Atari system.

The only real advantage I saw in the C64 is the SID chip; SID sound
produced some rather nice sounding music.

But that's where my interest in the C64 ended... :)

IIRC, the 1541 runs stock at 2400BPS. With the Epyx FastLoad cart,
it's accellerated I think to 5200BPS. Compare that with the Atari
1050's stock 19,200BPS, the XF551's stock 38,400BPS, and the
doubled-1050's speed of an astounding 57,600BPS -- over 10x the speed
of a 1541 with FastLoad. That's one thing I always _loved_ about my
good ol' Atari.

> I did get to see the differences in sound and graphics from loading
>Archon. The intro music had more voices, in that version the "ARCHON" bounces
>around at the top of the screen.

I also recall seeing Impossible Mission on my friend's C64, which had
the digitized "Welcome! Stay for a while ... stay ... FOREVER!"
playing at the beginning of the game. I always kinda thought that was
neat, and at the time had nothing to compare on the 8-bit Atari.
(However, when I first got Whomper Stomper, I finally had something
that had digitized voice in it)

I don't think there are more voices in the C64 version of Archon
however; the C64 has 3 channels of SID sound, while the 8-bit Atari
has 4 Pokey voices.

One thing I didn't like on the C64 was the fact that DOS was built-in
to the 1541 drive, so you couldn't use a nice DOS like the Atari
could. I suppose you could have gone with GEOS and had a
graphical-style interface, but I much preferred Sparta on the 8-bit.

> Is it me, or was the C-64 slightly more of a game machine that the Atari?
>I think the lack of a disk operating system makes me feel that way.

Commodore wanted to market it as a business machine initially (after
all, Commodore's full name is Commodore Business Machines, or CBM) but
they ended up turning it more towards the field of games. I recall
seeing early ads on TV a long time ago touting its multifaceted
capabilities in both home finance, business applications, word
processing and yes, video games. However, it ended up being more of a
video game system than anything.

But then what could you expect, the Tramiels were running the show at
the time.

> Anyway, here is my first impression of a C-64. Now if I can only figure
>out how to work with the disk drive a little better through Commodore's basic.
>(grin)

All I know are the basics:

load "$",8,1:: - Get disk dir
load "*",8,1 - Load first executable
load "filename",8,1 - Load filename

The number 8 can be replaced with 9, 10, etc. depending on drive
number (8=1, 9=2, 10=3, etc.) I don't remember what the ,1 is for,
though, or the two colons at the end of the disk dir command, but I
always recall my friend doing it.

> (Any disk operating system on the Atari has me spoiled here). Hmmm... any
>chance of porting MyDos 4.5 to the C-64. ;)

It's funny what time and distance can do. In my 8-bit days, the
Commodore was unshakably the enemy. I was firmly entrenched in the
Atari camp, and felt it was my obligation to preach its virtues and
soundly denounce anything with the C= symbol. Nowadays, while I still
hold a great deal of loyalty to my beloved Atari machines, I view
things with a certain pragmatism. They all had their good and bad
points. I love emulating _all_ the classic machines, and have
emulators and software for almost all of them. It's great seeing what
all the different machines were like, how they worked, what their
strong and weak points were, and most importantly what it was like
being a part of the 'scene' in those days on those machines by
watching the demos made by different crews on the various platforms.
That's where you saw envelopes pushed and capabilities shown.

And y'know what? I havn't seen any machine outdo the Atari as far as
how far any crew has managed to push their particular machine. I've
never seen an 8-bit machine play 4 channel digital MODs while doing
fullscreen overscan with a large scrolltext and a few other funky
things happening on-screne at once. Except the Atari. (Hell, for
that matter, I've never seen another 8-bit machine play MODs at all!)

Ah, the good ol' days.

It will result in MFM. It's a function of the disk controller based on
the disk density and has nothing to do with the DOS format.

Wireframe graphics aren't terribly difficult, even on the 6502. It's just a matter of transforming the points using fixed-point math (on newer machines, floating point is faster than integer math, but fp is horribly expensive to do on the 6502) from world space to view space, then draw the lines connecting them (with Bresenham, presumably). Of course, this assumes you don't want hidden-surface removal.

> produced some rather nice sounding music.

Indeed. Sadly, music written for one system or the other didn't port
well. Compare the excellent 221B Baker St. music on the A8 to the c64
version.

> I also recall seeing Impossible Mission on my friend's C64, which had

> neat, and at the time had nothing to compare on the 8-bit Atari.
> (However, when I first got Whomper Stomper, I finally had something
> that had digitized voice in it)

221B Baker St. had digitized voice on the A8. Unfortunately, I was never
able to pick out more than one or two words.

> I don't think there are more voices in the C64 version of Archon
> however; the C64 has 3 channels of SID sound, while the 8-bit Atari
> has 4 Pokey voices.

Yep. SID just has neato features, not extra voices.

> > Similiar to the Macintosh version, the characters in Archon are

> >and years of play on the Atari, I prefer my characters without such an outline.

The different graphics systems also made it hard to port things well.
Compare Alternate Reality: The City on the A8 to the inferior C64
version, and Mail Order Monsters on the C64 to the graphically pitiful
Atari port.

> One thing I didn't like on the C64 was the fact that DOS was built-in
> to the 1541 drive, so you couldn't use a nice DOS like the Atari
> could. I suppose you could have gone with GEOS and had a

> number (8=1, 9=2, 10=3, etc.) I don't remember what the ,1 is for,
> though, or the two colons at the end of the disk dir command, but I
> always recall my friend doing it.

The ",1" indicates a "non-relocating" load. If you leave it off, you get
a standard load that places it at the beginning of BASIC RAM and
attempts to adjust the line links for the new memory location. This is
made necessary by poor Microsoft design. Atari BASIC stored the length
of each line, rather than the absolute address of the next line.

> strong and weak points were, and most importantly what it was like
> being a part of the 'scene' in those days on those machines by
> watching the demos made by different crews on the various platforms.
> That's where you saw envelopes pushed and capabilities shown.

I never really got the point of demos. It always seemed like a contest
to see who hung lower. Still does on the PC.

Hi folks,

I've been 'requested' by She Who Must Be Obeyed to sell some of my duplicate machines so try and get some space back before I relocate the museum, although I suppose it makes sense since it'll be yours truly who does all the lifting. I've got a small sale set up on the museum site that may or may not interest some of you; most of the collectors will probably snort, but I can but try. If no-one's interested I'll have to go against my instincts and auction the lot.

have a nose at www.binarydinosaurs.co.uk and follow the link to the garage sale. Any problems LMK.

cheers

witchy

Just replace the fan with something quiet. You must have bad bearings or a balance problem in your current fan. Take some new fans and plug them into +12volts. Use the best one you have .
To isolate the fan use rubber grommets and enlarge the mounting holes in the case. You probably can't unplug the fan if it has a rotation sensor, but I haven't seen many power supplies with them. More likely that you thermalled out with no air flow....

>sure if this will give you FM or MFM... - Andreas

Actually it formats 1040 sectors of which it can manage 976 in the VTOC; set aside the boot & directory sectors and you are left with 963 usable for data. BUT it is NOT 2.0 compatible because it shifts meaning of the bits in the VTOC during the expansion. The 931 version may not share this problem if it does not use bytes below number $0A in the VTOC.

-Ron

I don't have a solution but I admire the problem.

On Mon, 22 May 2000 16:44:26 -0500, Greg Miller
<gmiller@classic-games.com> drooled an embarassing wet spot in his lap
as he typed:

>Indeed. Sadly, music written for one system or the other didn't port
>well. Compare the excellent 221B Baker St. music on the A8 to the c64
>version.

True enough. SID sound had a more synthy sound to it, making it a
little more 'real world' sounding in a sense. I always found the pure
tones of the 8-bit a little too clean. The noise generator on the
8-bit kinda made up for that tho, and it was still possible to create
some nice music.

>221B Baker St. had digitized voice on the A8. Unfortunately, I was never
>able to pick out more than one or two words.

Early digitized sound on the 8-bit was fairly abominable. The only
alternative to actual speach in a game was the ubiquitous SAM, but
that just sounded _too_ cheap. Later digitization was more robust; I
recall getting the Parrot demo and was very impressed to hear audio
clips from Nu Shooz 'n stuff.

>The different graphics systems also made it hard to port things well.
>Compare Alternate Reality: The City on the A8 to the inferior C64
>version, and Mail Order Monsters on the C64 to the graphically pitiful
>Atari port.

This I think was because of the fact that the Atari used a display
list to construct its display. This allowed both for the mixing of
graphic modes as well as using display list interrupts to achieve up
to 128 colours on screen at once. Phillip Price made fantastic use of
this in his AR games, using multiple DLIs to provide gradiated skies
and mountains, varicoloured shop signs and amazing in-store scenes.
Plus of course his mixing of the graphical screen in the middle with
text modes above and below. Exceptionally clever. The C64 wasn't
capable of such things; everything was done in one graphics mode with
16 colours.

>The integration of the OS and BASIC was another drawback.

It was useful in that it saved time booting up DOS (you didn't have
to) but placing it in firmware before such things as flash ROMs
existed fixed their DOS so that it was irreplaceable.

>The ",1" indicates a "non-relocating" load. If you leave it off, you get
>a standard load that places it at the beginning of BASIC RAM and

Ah, how little Microsoft has changed over the years. :-) Too much PC
experience.

>I never really got the point of demos. It always seemed like a contest
>to see who hung lower. Still does on the PC.

In a sense that's quite the case. But it comes down to both a
showcase of the demo coder's talents, as well as a showcase of the
machine's capabilities, particularily with respect to how far it can
be pushed and how many tricks can be employed to make it do things its
designers never intended it to do. The 8-bit Atari is an ideal
example of this because of how many tricks you can do with display
lists and other interrupts. Were it not for the demo scene, we'd
never have seen the 8-bit play 4 channel digital music MODs, remove
borders (overscan), play digital sound at all without turning ANTIC
off to squeeze the last ounce of processor speed out to do it, or so
many of the effects many games adopted as the result of the discovery
of these advances in pushing that little machine to its limits.

Hell, many games and even game companies wouldn't have existed had it
not been for the demo scene. The Atari ST game company known as
Thalion (who made a number of excellent games for the ST, including No
Second Prize, which featured the fastest filled vectors I've ever
seen) was borne of ex-demo coders.

Mainly, demo coders came about first as a means of learning to
program, then as a means to make their computers do cool things to
showcase to gaming companies in the hopes they would get hired away
for their skills. Of course, there's *tons* of comparing who's got
the absolute most well-hard set of rocks in the world, with each crew
trying to outdo the other, but what the hell... it pushes other crews
to do better, and come out with better demos with more tricks and cool
stuff, and the gaming world as a whole benefits from new tricks when
they become incorporated into commercial software titles.

<Greg.Goodwinp0.f2.n8.z8@fmlynet.org> wrote:

WARNING: I was always an Atari person until I got my PC starting with a
VCS/2600, then 1200XL, and then 1040STf.

That being said, I preferred the character art of the C64 in Archon than the
Atari 8-bit version. The characters were more defined and looked more
realistic. The C64 had more useful pixels and colors. I know Atari
people will point out GTIA and 256 colors... But practically all
those modes were worthless of real gaming. They looked awesome in
demos (which killed the demos of the C64) but you don't buy a computer
for demos. However, I still prefer the Atari version to actually play. The
speed was so much better and the Atari had overscanning. I always that that
was a huge advantage for the Atari. Look at the LucasArts games...
Ballblazer sucked big time on the C64. It was slow as molasses and had a
huge-ass border around the game.

To compare the Atari 8-bit to the Vic-20 is a huge disservice. If anything,
it's shocking how similar the Atari 8-bit is in performance to the C64
considering that Commodore had four additional years to better the Atari.

I think the main reason why the Commodore had better (cross that, make it
"more") games was because it was attracting the best programmers because of
its market share. The Atari then started getting all the crappy, sloppy ports
of the C64 versions. Games were made first for the C64 and a smaller
programming team would be assigned the task of porting the game. The
company I most hated was EA because they loved the C64 and treated Atari
like a second-class machine. I still remember the campaigns to get
certain games released for the Atari. Look at games that were tailored for
Atari hardware and you see huge advantages. I always showed off the LucasArts
games (Ballblazer, Rescue from Fractulus, etc.) because they blew away the C64
versions.

Not really. If used in a clever way, the bits do not have to shift their
meaning. The extra bits at the beginning of the VTOC would have to be used for
the spare sectors at the end of the disk, the ones above 931. That's how my
"private" Dos 2.XL works. (-; But that's more than just a tiny adjustment by
a few peeks and pokes. It was a re-design of the FMS kernal.

So long,
Thomas

The one I use is the VGA-801. You'll find it at www.mat-co.com for 69$.

Well, if I don't get it again, I'll make my disassembly available. It's
far from complete as far as analysis goes as I was mostly just interested
in the disk handler portions and even that's still incomplete.

Trouble is SIO2PC is so easy to use I sort of gave up on a project to use
the MIO with 512-byte sectors.

>either like the drive loading sound or not (I do). Naturally, like any other
>computer, the C-64 does not have this, and EGAD that drive is slow!!!

Yep, the drive was VERY slow, some turbo tape loaders were much
faster..Go figure. With time they had X25 loader hardware etc but the
base drive was indeed a sloth..

As for the hardware's quality I have to agree, the Atari's felt like a
computer and looked like one where the C64 looked more 'toy'.

> I did get to see the differences in sound and graphics from loading
>Archon. The intro music had more voices, in that version the "ARCHON" bounces
>around at the top of the screen.

I'd rate the graphic's on the Atari as being better in technical
terms, I would have wished for the sound chip and the better sprites
of the C64 but with the other Atari custom.

> Alas, considering the Atari8 was originally built in the days of the
>Vic-20 and continued competing with this computer of another generation of
>Commodore I have to say I'm impressed. I have fun every so often tinkering on
>the C-64 to see what could have been on the Atari.

That's the spirit, I so often see direct comparisons with the C64 but
they fail to take into account the age difference between them. For
it's day the Atari was far in advance of the competition and in
certain departments overshadowed the C64 in hardware usability but the
age difference allowed for a few changes.
>
> Is it me, or was the C-64 slightly more of a game machine that the Atari?
>I think the lack of a disk operating system makes me feel that way.

I think it was marketed more as a games machine, later on Commodore
tried to market the Amiga as a business machine and made a right mess
of that. Certainly the C64 has that games computer begging to be a
console feel which was exploited more with carts later on in its life,
infact Commodore released a 'console' version towards the C64's end.

The Atari just feels like a computer that also happens to have some
great games where the C64 just feels like it happens to have a
keyboard as more of a add-on/gimmick item.
>
> Anyway, here is my first impression of a C-64. Now if I can only figure
>out how to work with the disk drive a little better through Commodore's basic.
>(grin)

Don't bother...Use a nice Fastloader cart and any custom loaders it
offers :-)

Been there done that. Drive waits for next sector to come up, but
still sends the data at 19200 baud
There is actually a slightly faster std format for single density. You
will however need usd or compatiable drive and spartados to do it. I
cannot remember excatly how it is done.
Std sector layout for single density is
1,3,5,7,9,11,13,15,17,2,4,6,8,10,12,14,16,18,G
Fast format is something like this
1,G,18,16,14,12,10,8,6,4,2,17,15,13,11,9,7,5,3.
Where G is the iinter record gap, the length of which is about one
sector.
I cannot say for certain I have the gap in the right spot.

I can do almost the same with a simple switch on the side select line
inside the xf551drive with out the new OS.

One thing I read about C64 drives I read somewhere is that they must
be programmed to respond to different drive numbers each time they are
turned on. Not like the atari drives with the little slide switches.

Not really true. The drive numbers -can- be changed in software. If you want to change them in hardware, on the original 1541 you have to make a slight hardware mod (cut a solder trace or two.) On later drives they installed DIP switches.

No, I mean the OS, not DOS. They wrote the OS and BASIC almost as a
single program.

Indeed. I remember a while back when Future Crew attempted to become a
game developer. Unfortunately, the only game I saw from them was
extremely unimpressive.

I've never really noticed much of that happening in practice. It's not
totally unheard of, of course.

I disagree. Games designed first for the Atari typically looked far
better on the Atari than games designed for the 64 did on the 64. That's
why I bought an Atari in the first place.

> I think the main reason why the Commodore had better (cross that, make it

> versions.

Absolutely. Trip Hawkins (former CEO of EA) hated Atari. It was a
personal thing. As a result, the companies he bought typically stopped
developing Atari versions of their software immediately. Remember when
Hawkins left EA to form 3DO? Remember the lie about the Jaguar having
two 32-bit CPUs in an attempt to discredit the Jag as a "64-bit"
machine? He despised Atari. He also had a lot of friction with Origin
for quite a while, which is how the evil "Pirt Snikwah" got into one of
the Ultima games.

Can you see the head move out to track zero at power up? It should
step in and then back out. If not, you've got a blown track zero
sensor. Only other thing that I can suggest is that you shoot some
contact cleaner on the drive select switches, work them and set them
both to the left looking from the rear.
I fought one drive for a month, it kept thinking it was D1: even
though I set it for D2: dozens of times, until I used the contact
cleaner on it. Its still working fine as D2:

<gmiller@classic-games.com> drooled an embarassing wet spot in his lap
as he typed:

>No, I mean the OS, not DOS. They wrote the OS and BASIC almost as a
>single program.

Well that's a little silly, isn't it?

Er ... right. Microsoft. Silly's a *good* thing. A *good* thing...
(repeat 10x)

>But does that really matter? If it never gets used in a game, utility,
>or application, what's been accomplished?

It's not even whether it ever *does* get used in a program. The fact
is, it's there for the using. If someone uses it, fantastic. If not,
it still made the machine do something no one ever thought it could
do. For the demo coder, it's the thrill of exploration, of discovery,
of doing something no one else thought of, or that no one else thought
could be done. I've been there, done that, and it's a pretty damn
giddy feeling, lemme tell ya... :-)

Anyway, the accomplishment is in the discovery. What use it gets put
to after that is largely irrelevant to the coder. What good's digging
up old bones and reconstructing them into skeletal dinosaurs if they
can't bisect you and swallow your torso whole? Point is, it's the
discovery and the knowledge gained from it. That, when you get right
down to it, it might be utterly useless in any practical sense is
moot.

>Indeed. I remember a while back when Future Crew attempted to become a
>game developer. Unfortunately, the only game I saw from them was
>extremely unimpressive.

They attempted on the PC tho... where pushing the envelope means
requiring users to upgrade their entire system...

>I've never really noticed much of that happening in practice. It's not
>totally unheard of, of course.

Naturally not. The main reasons many things never got incorporated
into commercial software titles was either because the effects or
routines themselves were too processor intensive to be used in
conjunction with the myriad other things a game would have going at
the same time, or because simply no one picked up on the how-to.

3184. Read This, It will make you think twice about criticizing an Atari cart.

>the data got erased all the time). Can someone help me understand this?

its easy. they want to make a quick buck off you being scared that your
game is going to get erased. I don't think its even legal to make a
backup copy of a ROM (but of course who would care with an atari game.)
I read in some software copyright law book that ROMs are considered
"durable" and so making a backup copy isn't necessary (like it is with
magnetic media.)

backing up an atari cartridge is absurd. the games are stored in ROM.
that's solid state (one chunk of silicon with different concentrations
of ions implanted into it to make transistors.) you cannot corrupt the
data because you can't move the ions around in the silicon lattice
(just like its impossible to move the colors around in a chunk of granite.
you can't do it unless you break it up into pieces.) the metal pins on
the ROM package are connected to certain places on the silicon by tiny wires.
plastic (or ceramic) is poured over all that and formed into the ROM package.
its all one chuck of plastic and metal with no holes, no spaces, and no
mechanically unstable parts! the ROM is then soldered into place on the

little printed circuit board (PCB) and then mounted in the plastic casing
of the cartridge.

there are only 2 ways that I can think of that an atari cart can go bad.

1) if a large voltage or static charge is taken across a transistor on the
silicon chip then the transistor will get "fried" (caused by so
many electrons moving through a small space at once that the physical
properties of the silicon are changes in that area of the chip.)
this will permanently damage the chip and your game won't work.

2) there is corrosion on the metal contacts on the game's PCB that keeps
electrons from flowing easily from the atari console to the game's
PCB.
that can be fixed by cleaning off the corrosion with a pencil eraser,
a Qtip with alcohol, or a very fine sandpaper if its _really_ bad.

I have over 2,000 atari carts and I've only found a couple that don't work
after they're cleaned.

exactly how durable are atari carts? I thought I'd see for myself...

I took a combat cart that was made in the 32nd week of 1981 (you can tell
by reading a little number code printed on the ROM) and did some experiments
on it to see what how much abuse it could take and still work.

1) I took the cart and dropped it out of my 2nd story window onto the cement
5 times. the plastic part of the cart was in pieces, but the game
still worked.

2) I put the cartridge back together as best I could and put it out in the
street. it got run over by a jeep. took it inside and it still
worked. at this point there was nothing left but the PCB with the
ROM soldered on it (and a metal cover that went over the ROM.)

3) I then put the PCB in boiling water for 5 minutes, took it out and
immediately packed it in a snowball that I made out of frost from my
freezer. after 5 minutes in the frost ball, I broke all the ice off
it and plugged it into my atari... It worked!

4) I have this magnet that's so strong that if you hold it within about 1.5
feet from a TV screen all the color gets sucked to one side of the
screen! well, I took that magnet and rubbed it all over the PCB and
ROM. plugged it in... and it worked!

5) next I took a lighter and held the ROM right above the flame. I left it
there for a few minutes until the ROM was smoking and giving off
a nasty smell. I cleaned off all the suit and plugged it in and
it still worked.

6) okay, no more mr. niceguy! I took it outside and had 3 cars run over it,
I threw it up as high as I could and had it land on the cement twice,
and I threw it down onto the cement as hard as I could twice. at
this point the metal cover that goes over the ROM had broken off, the

PCB was chipped on all the corners, the ROM was smashed onto the PCB
so that the pins were all squished on one side and were being pulled
out of the solder on the other side. I had to straighten out the pins
so that none were touching each other and I had to hold the PCB
together in one place so that the metal contacts would be in the right
place when I plugged the game in. guess what... it _still_ worked!!

7) it had taken heat extremes, shock, and magnetism. next up was
electricity. I took the atari power supply (9V, 500mA) and connected
some alligator clips to the output terminals of the power supply.
then I rubbed the other end of the alligator clips across the metal
contacts on the game's PCB. I tried a bunch of different
combinations and always had both alligator clips touching the PCB
contacts so that electricity would be flowing. I plugged the game
back in and much to my surprise it still worked!

8) I grabbed my hammer, laid the game down on the cement and gave it a good
smack. the ROM cracked right in half breaking the silicon wafer.
I plugged the game in and of course it had died on that one.

it took all that abuse to ruin a 13 year old atari game. I'd say they're
pretty damn durable!

It's also not at all true. The C64 Kernal and C64 BASIC are two separate programs. You can ditch BASIC and retain the Kernal. Just because both were loaded when the computer was switched on doesn't mean anything.

Good idea to replace the fan asap. At the moment it is not dissapating the
heat properly, this causes components in the PSU to overheat and eventually
die a grizzly death, possible causing data loss if youhappen to be using it.
The noise is the sound of buggered bearings.

The control box gets its power from the laser printer; the printer has to
be connected and powered up before your computer will access the hard
drive. Put the hard drive first in the daisy chain, disconnect the
controller box, and boot up. If you want to print something, power down,
connect the controller box to the hard drive, connect the printer to the
controller box, make sure the printer is switched on, and power up
everything else. Make sure the drive is ready before powering up the
computer, whether the laser is connected or not.

Hmmm... Sounds like the SIO connector pins might have a cold solder joint at the board. Try reheating all of the pins of both connectors and add just a small bit of solder to refresh the connections. They do break from plugging and unplugging the SIO cables. I've had to do that many times on various drives.

When you read the directory of a freshly formatted disk, how many total
free sectors do you get? If it's 707 it SSSD, 1040 it's SSED, 1440 SSDD.
If you get anything over 707 you have an enhanced 810 drive (Happy or
other enhancement). The OEM 810 could only do SSSD. The drive also has a
full size (about 2 1/2" tall drive mechanism). If the drive mechanism is
1/2 height, is is definitely modified.

Never had a problem with carts, they either work and work well, or I
recive them in a 'dead' condition. i have never had one die on me,
though one or two have proved 'tempremental'. The wonder of plug & play
also appeals.
However on cassette and disk, thats another problem. As time goes by the
media just rots, degrades call it what you will. Disk is way more
convenient than casette, but finding soft sectored double density disks is
getting tricky. It would be nice if a new production batch came out, or an
alternative media and drive(1.44mb, HD floppy, but even thats getting
phased out) to come out with software to 'rip' the old software to the new
media. However two problems, :-
1) the retro market is too fractured for serious production to be
considered.
2) Licencing and copyright.

Its good to see a company tranfering some of the games to cart (durability
problems fixed) also many of the origional disks for my atari seem to be

surviving way past the expected life span but there will come a day when the plastic they are made of will fail, that concerns me. Thats why i am interested in making back-ups while I can.

Track zero seek is fine.
Imagine the drive just not being connected to the computer.
It's just like that.

Cheers.

Rob.

3198. Can Anyone Name This Educational Game?

Newsgroup: comp.sys.atari.8bit
Date: 2000-05-24 00:00:00 UTC
From: grot2@excite.com
Message-ID: <pb6ois81pjj5kr61bhrvf80l2scjfipfvo@4ax.com>
Source record: 44565

Hi all,

I've been searching for this for some time now, to no avail. I can't figure out the name of a game that an old friend of mine had running on, I think, a 2600.

The game concept was that somebody's TV set had gone on the fritz, and infected people with the "fuzz". Infected people (showing as black hats) would infect normal people (white hats) by bumping into them. Special crystals lying on the ground would change infected people back to normal. The crystals would multiply by themselves. Uninfected people would pick up crystals, and drop them when infected people were near.

Trains would run between the U.S. cities, carrying both normal and infected people.

The player would try to eliminate the contagion through strategic placement of crystals. Progress could be monitored at terminals in state capital cities.

The educational point of the game was to have kids learn what the state capitals were.

Anyone have any idea?

Many thanks,
Adam

Hi JP,
Totally agree with you RE: making backups of disks. The old flippies are kind of clumsy. I have to go to the local goodwill to find flippies anymore (usualy, if they have a box, $1 for a 10 pack). Drives me nuts. Anymore, you are expected to keep all your docs on your hard drive, since the 1.44MB disks are slowly phasing out. What about portability? Should everyone get a laptop? Or perhaps some new form of data transfer will be created. Just as long as data transfer is available, I don't care. Anyhoo, I have rambled on.

3203. 2 Alternative Party -- Event for computers with personality

Newsgroup: comp.sys.atari.8bit
Date: 2000-05-24 00:00:00 UTC
From: Kristoffer Lawson <setok@fishpool.com>
Message-ID: <8ghg4o$6r7$6@news.bbnetworks.net>
Source record: 44570

2 Alternative Party ... Computer Party ... or something

This is a supremely official advertisement about the rebel of all computer parties, the 2 Alternative Party. Are you tired of the boring conformists who spend all their precious youth at mindbogglingly mainstream computing events? Events which don't even deserve to use the term "party"? Events where machines with personality are oppressed beyond all recognition and without glory?
The 2 Alternative Party is a venemous strike against the majority. Where devoted users can take part, whether they own a Spectrum, MSX, Altair, Cray or any other weird and wonderful combination of chips. Nothing about the party is normal. Nothing would be shown on Top of the Pops. It wouldn't even be allowed to appear on Fashion TV during an advertisement break as a tiny subliminal message with the picture distorted.
Unique competitions will be organized, including: ST-01 Music Competition, Obscure Music Competition, Source Code Graphics Competition, Obscure Machine Competition and the highlight of the party: the all-machine Demo Competition.
If you feel different -- special even -- mark the dates 7th July to 9th July into your calendar brain implant. Then add a note to be in Helsinki, Finland at that time and finally burn the text "2 Alternative Party" into your neural pathways with big, friendly, pink letters.

For more information:

>--
>Robert S Ely

Actually an empty SSDD disk will also report 707 free; it is the size of the sector and NOT the number of them which has increased in double density. IIRC, DOS 2.5 reports 999+ free in SSED even though the count is 1010 available of the 1040 raw formatted sectors. For double sided, MyDOS reports 1428 free in either SD or DD; once again it is the number of bytes in the sector rather than the quantity.

-Ron

I don't have a solution but I admire the problem.

>well, it is in ED instead of DD.

Boy, that is one MODIFIED 810! I have seen them do a DD mod, but never ED on the 810. I have also never seen ANY DOS report 1040 free in ED; that is the theoretical max before you lose the overhead like directory, boot, and VTOC which DOS keeps for its own use.

-Ron

I don't have a solution but I admire the problem.

3206. Arcadia 2001/LeisureVision Games Wanted

I am looking for the following Arcadia 2001/Leisure Vision games

Pleiades
Funky Fish
Route 16
The End
Super Gobbler
R2D Tank
Grand Slam Tennis
Tennis: Yannick Noah
Soccer
Space Mission
3D Soccer (Fussball)

I'll pay cash or I have stuff for trade (almost any system).

Source record: 44574

Just to add a couple of comments from a C64 user who likes his 130XE just fine:

1. Back in 1982 when the C64 was introduced, I remember Atari 8-bit being much more expensive, and being sold as a game machine with a keyboard, whereas the C64 was sold as a home computer. If the Atari was priced competively, I'm sure it would have gained a bigger popularity.

2. Since the Atari 800 was designed in 1979, C64 had 3 years of extra knowledge, which I think made it a tad more flexible system, with great memory organization and full-screen editor. But since it also had to keep some of the compatibility with the VIC-20, it got the SLOW drives and BASIC 2.0.

3. While we may argue what is better, loadable DOS and dumb drives as in Atari, or smart drives that had their own DOS as in C64, I sure like the speed of even the standard 1050 as compared to the C1541. But modern solutions, such as CMD drives or even the 3.5" 1581 drives are very fast.

4. In the pet peaves department, I could never get used to the cursor keys on the Atari.

All in all, I really like the multi-color abilities of the Atari, and the SID from C64.

By the way, for a fun disccusion of 6502-based computers vs. Z80-based computers (Sinclair Spectrum in particular), follow this link:

http://www.ffd2.com/fridge/speccy/flamefest

How many cartridge games came in the huge black boxes with the nice
artwork ? Over time I've acquired these:

Star Raiders
Defender
Space Invaders
Asteroids
Missle Command
Pac-Man
Centipede
Galaxian
Music Composer (I know, not really a game).

Any others? Remember, disks or cassettes don't count.

Gene

3212. Problems Copying Discs From PC to 1050 via 65XE - Help Please - Thanks.

Newsgroup: comp.sys.atari.8bit
Date: 2000-05-25 00:00:00 UTC
From: rob@syroxdev.co.uk
Message-ID: <392d1eca.246992678@news.supernews.com>
Source record: 44579

Hi,

Because I'm new to all this malarky I'm having some problems with what
I assume are some really rudimentary tasks.

I've got the Full Disc version of Ballblazer (for example) , the one
with the intro as it loads and i'm having problems copying it.

I'm using MyDOS4.53/4 and the "Duplicate Disk" command.

I type "J"

I type "1,2" followed by RETURN

The atari reads sectors from the PC with the SIO2PC cable for a short
time and then fires up the 1050 which I have switched to device 2.
A rapid series of head stepping sounds comes from the 1050 as if it's
formatting the disc and after a short while this stops.

MyDOS doesn't report any errors but when I check out the floppy by
hitting "2" on the atari I get a directory listing with 708 bytes
free.

It looks exactly like a formatted disc.

Please would someone tell me what i'm doing wrong and also would
someone suggest a way of getting this ATR file to a floppy.

Many Thanks,

RB.

First, have a look at the directory on the original. It's not necessarily a standard DOS format so you may see the same (or similar) thing. A lot of old software used boot disks which were not DOS formatted; some like Print Shop even had their own formats/DOS.

With MYDOS, force DUP.SYS into a full sector-copy mode by specifying a range of sectors in your J command. I think the entry in response to the "J" prompt is: "1,2 (1-720)" but I don't use MYDOS enough any more to be certain as to the parentheses, etc. Alternatively, try using a straight sector copy program like MyCopyR!

Thanks for the reply.

I understand a little better now what I must do.
The only problem is I cannot find any documentation for MyDos that
will tell me the syntax for the sector range and i've had no luck with
all the conbinations i've tried.

Also a quick zip though all known search engines has drawn a blank on
a program called mycopyr.

Can anyone direct me to a complete and detailed explanation of how the
"J" command in MYDOS works please?

TIA

RB.

Hi,
Many of the users of this BBS agree that if someone wants/needs it, give it to them or trade. I have found this out by the eagarness of my fellow users to send me programs, etc. I have been offered surplus hardware as well. If you want to sell, try eBay.

Download MYDOS 4.50. That's the last version for which full docs were
released. There aren't enough differences between 4.53 and 4.50 to
worry about.

Wrong attitude. Better he sells it at a reasonable price to someone
who will enjoy using it than he throws it out. After all, no one's
going to oblige us by producing replacement parts for 8-bit Ataris.

>rob@syroxdev.co.uk (Rob Brooks) asks:

>Can anyone direct me to a complete and detailed explanation of how the
>"J" command in MYDOS works please?

Mr Picken provided correct syntax for the MyDOS "J" Duplicate Disk command:
1,2(1-720)
one comma two paren one dash 720 paren
The required parameters are source drive and destination drive separated by a comma. The options are "/N" for do NOT format the destination and "(first - last)" to force a range of sectors in lieu of using the VTOC. Examples: 1,3/N(360-368) or 1,2(1-1040)

Try this site for sector copiers:
http://www.newbreedsoftware.com/xlsearch/

-Ron

I don't have a solution but I admire the problem.

3224. Re: Problems Copying Discs From PC to 1050 via 65XE - Help Please - Thanks.

Newsgroup: comp.sys.atari.8bit
Date: 2000-05-25 00:00:00 UTC
From: Russg <russg@en.com>
Message-ID: <392d90cc$0$73586@news.voyager.net>
Source record: 44591

From the MyDOS 4.5 main.doc:

****
J. Duplicate a Diskette

The "J" command copies all the information from one diskette to another. The information to be copied form the source diskette is determined by specifying a starting and an ending sector number. If the range is not stated, the sectors marked as in use in the DOS bit map (on the VTOC sectors) are copied. The VTOC may be constructed by Atari DOS 2, any version of MYDOS or any other compatible operating system.

Specifying a sector range is done by adding two numbers separated by a dash and enclosed in parentheses to the end of the drive specification(s). For example, to copy sectors 19 through 54 (tracks 1 through 3) from drive 1 to drive 3 without formatting the diskette in drive 3, the command line could be "1,3/N(19-54)". To copy the entire disk from drive 1 to drive 2 after formatting the diskette in drive 2 the command could be "1,2(1-720)". This is the

MYDOS User Manual page 8 Version 4.50

proper way to duplicate a non-MYDOS compatible diskette (of course, copies of "copy protected" disks will not normally be usable after copying but data disks for some word processors and games can be backed up this way). Enhanced density disks may be duplicated in the same manner: "1,2(1-1040)".

If the destination disk is already a properly formatted diskette, the "/N" modifier may be entered after either drive number to skip the formatting of the destination drive. Otherwise, the destination diskette will be formatted before the data from the source is copied to it. That is, either "1/N,2" or "1,2/N" will copy from drive 1 to drive 2 without first formatting the diskette in drive 2.

Note that the "J" command, like that in ATARI DOS 2, will use all of available memory to duplicate the diskette: this means that if memory has been saved using the MEM.SAV file, it will no longer be valid. Any pending program cannot be restarted after a "C" or "J" command.

Uhm, Nelson.
Could it be you're using the 'loader' program instead of the saver.
I have miocng.com and mio.com. One saves, the other loads. Anyway
if you try to save with the loader program, seems like that might be the
problem.
I also have bswap, for swapping mio (or BB) drives from Sparta.
And finally, there's one called 'huh.com'. This is supposed to report
what the mio config is.
Actually because I got confused by the mio.com and miocng.com, which
program did which, I changed the names to miosave and mioget for
my usage.

I had a SLM that the controller box had its own power supply. So I could leave the printer off and the controller would still get power. A local Atari dealer had done the mod and it worked great.

Adrian,

Open up your AUTO folder and you'll see the Diablo/SLM emulator file.
Rename the file (change the filename extension from PRG to PRX) so it won't
Autoboot. If you want to reconnect the SLM later, just rename the file back
to PRG so it will autoboot and recognize that the laser printer is attached.

What's happening is the system is hanging trying to find the SLM which isn't
attached, preventing it from booting properly.

Easiest way to get to the AUTO folder to to plug in the laser printer and
boot normally. If that's not possible, you can force the system to boot
from floppy disk by holding down the option key on bootup. Then run your
hard drive software from floppy and create a "C" icon (make sure its a
capital "C" -- the Atari system associates a lower case "c" with a
cartridge), then open a window for drive "C" and then you'll be able to get
to the AUTO folder.

I have my system set up with Desk Manager so I can select any of several boot configurations. If by mistake I select "LASER" when I have the printer and controller box disconnected, all that happens is I get a message "SLM not found" and the Diablo emulator is disabled. The rest of the boot proceeds normally.

The software isn't the problem. If the controller box is connected to the DMA port and the printer isn't connected to the controller or the printer isn't powered up, DMA isn't possible. This is because of the circuit design of the controller box. There was a device called Phantom of the Laser that would compensate for this problem, but it's extremely hard to find these days.

I am asking because I know they were many 8-bit games and demos from Poland long after everybody else dropped coding for it. Anybody have most of those titles ? That would be cool to have on a FTP server or a website.

To begin with, can someone send me all the names of games released in Poland (as many as possible)

I would love to get them up on my pages, so ATR's would be highly appreciated. I would like the names of the games that was released commercially too, but if they still around to buy, no ATR's, I rather buy the game if possible.

Thanks and take Atarian care

Thanks to everyone who posted regarding my difficulty in reading plain
text. :)

It seems that if you put a space between the destination drive and the
(start sector-end sector) it doesn't want to know.

"1,2(1-720)" works just fine and I was able to dump my ATR file to a
floppy with no problems.

Thanks again.

RB.

Best of luck there Vidar..

Slightly related, with you searching for the real item rather than an
image it made me think if a company called Computer Exchange in London
who are selling in the Retro section a boxed cart of Star Raiders for
60.00UK pounds!!!!

(I thought it was a typo!!)

I got mine for 7.00UK a couple of years ago..

I think they want the same price as they want for an Atari Pong
machine...

Not to mention "BUSY SIGNALS"!

Gawd! I remember trying to get a CONNECT 300 BAUD to the semi famous, semi popular Itsy Bitsy BBS in the early 80's. It was fairly late in its career by then, so it was run on ~a 10 meg Corvus HD.Sometimes I would start trying right after I got off work, and not be able to connect until 2-3 AM.

Itsy Bitsy had recieved several reviews and had a write up in "Free Software for Your Atari", so it had callers from all over the world.

I was limited to 30 minutes, so if I tried to D/L a file longer then ~7k I would be logged off in the middle of the down load.

I replied to your e-mail address instead of to the group before. Sorry about
that.

The way my MIO is setup is:

D1: Hard Drive Partition
D2: is the MIO 1-meg RAM drive
D3: Floppy #3
D4: Floppy #4
D5: Floppy #2
D6: Floppy #1
D7: Hard Drive Partition
D8: Hard Drive Partition

I found the original Toolkit disk from ICD and tried miocfg.com from there.
This time it saved the file to the D1: drive, but, D7: thru D8: disappear. I
get error 144 if I try to access them. BTW, hiting the reset key brings the
MIO back to normal. The MIO never losses it's configuration. I can save the
MIO configuration to the hard drive from the MIO menu just fine. I just want
to have a backup on file in case I reformat the hard drive.

I'm in search of the software that came with the book
Atari Graphics and Arcade Game Design by Stanton. Actually, it didn't
come with the book -- you had to send away for the disks. Which,
I suspect, is why they are so hard to find.

If you have them, please drop me a note.

~7k? 300 baud modems back then got somewhere in the neighbourhood of
28 bytes per second, which rounded out to approximately 1.7k per
minute, so a 7k file would've taken you approximately 4 minutes to
transfer.

'Course, that's just semantics; it _seemed_ like half an hour. I
remember starting a download that totalled about 150k, falling asleep
at my keyboard at like 1am, and waking up to find it was done. (Let's
see, 150,000 bytes at 28 bytes per second ... an hour and a half!

Good God, I can't believe I survived that. :-)

Yeap, 99% sure Itsy was run in BASIC, so by the time you logged in,
navigated the menu system, started a download, you already blew about 5
minutes. I still remember the name of one of the files I tried to get 15+
years later <it was 9k> I tried so many times.
>
> 'Course, that's just semantics; it _seemed_ like half an hour. I

> Good God, I can't believe I survived that. :-)

Itsy would log you off right in the middle of a download, had it happen
dozens of times. It was good in someways since it was so popular of a BBS,
but kind of implies the sysop had it checking for how long you had been
online no less then after every xmodem block. The actual file transfers were
so slow, I wouldn't be surprised if he was checking time online after every
PUT and the xmodem checksum had to have been calculated in BASIC vs a USR().

I still really liked that BBS though. He had an Atari character graphic
space shuttle take off on screen at login. Eventually I moved over to
Compucat which was another popular BBS and one of the first online stores.
They were fairly popular since they advertized in ANTIC and IIRC, when HES
came out with a 300 baud modem for the C64 they included Computcat with the
documentation as one of the bbs's to try calling.

>I just happened to find this and wanted to share it. Really good, makes you
>think twice about criticizing an Atari cartridge!

In 1984, my Basic Cartridge got fried while I was using it in my Atari
400. I needed it for my budget program, so I had to buy another. They cost a
fantastic 80 bucks at the time (figure backwards, allowing for inflation, and
see how much that is now.) You have to remember, that was a little before
Tramiel bought the company, when Warner Amex was still trying to screw
everybody.

At this point I never allow myself to be dependent upon anything that
can't be backed up.

3259. Two New Sparta DOS Utilities

Newsgroup: comp.sys.atari.8bit
Date: 2000-05-27 00:00:00 UTC
From: Tom Hunt <tom_hunt361@my-deja.com>
Message-ID: <8gp1ih$8np$1@nnrp1.deja.com>
Source record: 44626

For Sparta DOS users, especially those with MIO's and Black Box's:
I've just released RCOPY and RDELETE. These are recursive utilities
that have the ability to operate on all the files and subdirectories in
a directory tree. RCOPY is great at mirroring a directory tree from
one hard drive to another. RDELETE is great for deleting all files and
subdirectories in a directory tree. Get to them at-

http://members.xoom.com/cc65foratari/cc65projects.html

Please note that the xoom server is sometimes overloaded, so if you
can't get the web page at first, just keep trying. The files are in
ZIP archives, so if you want to unzip them on an Atari 8-bit computer
you also might want to download the unzipper at-

http://cth.tzo.com/featured/unzip/unzip.html

BTW- The unzipper works with many different types of DOS.

Take Atarian Care! (We miss you, Mike S.)

>"Grzegorz Sosiï¿½ski" smadm@strazmiejska.waw.pl remarks:

>If You have drivers for The Atari CX-85 Numeric Keypad please send me.

Here is the BASIC poker for the CX-85 handler; it has been reassembled for $620 (1568) to avoid conflict with the 1030 code at $600 (1536). It was written as a vertical blank routine by Brenner in an old Computer Shopper. Line 280 contains the assignments of the Key Codes (not ATASCII) for DEL, 4, 5, 6, NO, 7, 8, 9, YES on the numeric pad. Line 290 defines 1, 2, 3, 0, Period, RETURN, Minus, ESC; you could redefine with new key codes in the proper location. After it is poked, you could make an executable file in DOS with a K Binary Save from address $620 to $686 with initialize address of $672; and then possibly make it an AUTORUN.SYS file. It could also be reassembled for the cassette buffer at 1021 ($3FD) to allow other uses for page 6 if a tape is not in use.

'ello,

Since the first sale was such a success (except for a poor ol' pair of
Amstrad CPC6128s) I'm selling the stuff I didn't think would sell in
the first one :) You'll see what I mean if you have a look.

http://www.binarydinosaurs.co.uk and follow the link.

No Sinclair or Atari stuff in there this time I'm afraid, but I know
some of you are collectors of other stuff too.

cheers!

Silence is deadly?

The MIO rom is configured to read d8 as a Ram drive, in order to format it out you need to swap it to another drive i.e. D6: or 7, 5,4 3 ect. then reset it to d8:. Not sure what you are attempting on the MIO, if for Atari 8-bit will work fine but to a PC, have no expierence there as I do not use the cables ect.

For other users of the MIO, generally if you have a problem with the MIO keeping the
drive information you have set the problem lies within the 50 pin cable from the Mio to the computer.

You just have to be smarter than the builder of the Atari 8-bit. There are substitute
IC's out there that work perfectly, and drive modifications that replace what Atari thought they had a monopoly on available today. You just have to be initiative and look around for what you need.

bob

Hmm, it always made this much noise. Couldn't it just be the
fact that the
empty case (no motherboard and carts and stuff, just 3 drives and
an HD make it
sound more hollow? It sound so "metally".

CU Mathy van Nisselroy

Yes, an empty case can make noise. Make sure all of the screws
are in place and tight. If you lean close to the fan and the
sound gets louder, then the fan might need replacing. Using
grommets to isolate the fan is a good idea. Also, some
insulation(a small pillow) in the empty area of the case can
provide dampening(just dont block air flow).

Saw it forsale on some UK ST suppliers, but they wanted ~$20 for it. Saw it in some chip suppliers pages, but no prices listed.

Seems like it is listed as "software compatible with the GI-8991<? forgot> chip" which may still be available from Radio Shack.

Just do a web search for the part number, it turns up about 25 listings.

> for quite some time, and now I've been reminded how computers
> OUGHT to be!

And with this message, I announce that I am back as well. However, I never succumbed to the PC or Mac crowds. I am typing this from my Amiga 2000 (also have an Amiga 4000 and an SGI Iris Indigo), and my Atari 130XE is still set up and only about 4 feet away as I type this.

I finally got around to installing an email client that also handles newsgroups (Microdot II, yes it is actually called that :o)), and I've spent the last few hours getting caught up on 9 different newsgroups, including this one. The program is a demo version, so it quits after 30 minutes. I had to keep re-running it to get it all done. I'm going to send in the registration for it hopefully Monday.

My Atari system consists of:

Atari 130XE, with the CSS US+ OS, SpartaDOS X 4.20, with Action!
and an R-time 8 plugged in on top
CSS Black Box with the printer spooler
3.5" CSS modified XF551 720K drive
5.25" CSS modified 360K drive
Maxtor 320M SCSI hard drive, divided into about 22 16M partitions
Citizen GSX-230 high speed 24 pin dot matrix printer
Magnavox 13" color composite and Y/C color monitor (I use it in split Y/C, very sharp) Amdek 410 TTL monitor, which I used to use with
an
Atari XEP-80 80 column card, before it died
Motorola 28.8 Modem which I use with Ice-T

I haven't done as much with it in the last two years as I might have wanted, but life kind of got in the way... :o)

Yes, I am back. It has been far too long.

////Pakrat

If you didn't care what happpened to me
And I didn't care for you
We would zig zag our way through the boredom and pain

Hi AtariGirl1983,

I recommend that anyone use ONLY Revision A or Revision C copies of Basic and avoid Revision B altogether! I have Revision A that I bought for my old Atari 400 and kept them. When I bought an Atari 800XL I tried using Revision B that was built into it which gave me fits. I borrowed a friend's Revision C cartridge to try it out, which it worked great, I relunctantly returned it to him.

AtariGirl1983 <atarigirl1983@aol.com> wrote in message news:20000528215834.06314.00000685@ng-cd1.aol.com...

Atari's cartridges are highly durable, but they should have a decent program on them to make them worth using.

Since you have both, avoid Revision B like the plague. Revision A had a
bug that B was supposed to fix. In fact, in "fixing" it, they made it
worse. Revision C is the properly "fixed" version.

Geez, that is a shame. Have never had a dead cartridge. One tried to die on me one time, smacked it real good and it was fixed. I have to do that to my BASIC cart all the time.

Hello all,

I must say, it's been quite awhile since I've done anything with an Atari computer. I sold most of my stuff recently and that got me all nostalgic. I kept a 130XE, 1050 and XF551 drives, and a black box. I fired them all up the other day. What a blast! Except for one thing, the 130XE keyboard really bites! Which brings me to the point of my message. I would like to upgrade an 800XL to 256k memory. I have a RamboXL PCB and the ram chips. I just don't have the doc's that tell me how to do it. I've done the upgrade several times but, that was many moons ago. Does anyone know where I might be able to get ahold of the doc's for this upgrade? Any help would be greatly appreciated. Thanks!

David

>
>Sorry to sound like a geek, but I've been in Bill Gates' world
>for quite some time, and now I've been reminded how computers
>OUGHT to be!

When I upgraded to the ST, I always kinda regretted selling my entire
8-bit system. When I'd heard about Derek Mihoka and his ST-XFormer, I
got all misty-eyed and homesick, so naturally I nabbed it, eager to
get back into all those classics and keep with the 'scene' 'n stuff.
'Course, that was a big letdown 'cos it didn't support P/M graphics,
DOS executables, or practically anything but the simplest of Basic
programs. :-(So I had to get my 8-bit fix with Speccy! emulating a
computer I'd never seen or used.

Fast Forward to three years ago, entering the nefarious world of Billy
Gates and his band of merry mice, and discovering the wealth of
emulators available -- including my favourite, the Atari 8-bit! Since
then I've amassed a rather large collection of stuff, kept as up to
date as I could with all major 8-bit emulators, and generally had a
great ol' time with it. It's not like having a _real_ 8-bit,
especially when I still can't get an emulator to run anything with
SpartaDOS (my DOS of choice) but it's getting there. Hey, I can play
the Alternate Reality games, at least... which occupied more of my
8-bit life than I'd care to mention. Now, if I could, by some utter
miracle, find those crappy games I wrote in Basic and Turbo Basic that
only ever got uploaded to local BBSs, I'd be in sheer heaven.

> fast.

It's not that you cannot program a 1541 drive :-)
If you want your own dos, you can still program your 1541's.

I agree with you regarding the CMD solutions..
The Harddisc by CMD has a built-in SCSI-Interface which makes it possible to connect an IOmega Zipdrive, MO-drives, SCSI-CDROM Drives or SCSI-Harddiscs to your C-64.. especially a Zipdrive is way cool for an 8bit machine!

And, yes.. it is extremely fast. Especially the RAMlink 16Megabyte Ramdrive (accu buffered) by CMD boots nearly any kind of software in less than a second.

> All in all, I really like the multi-color abilities of the Atari, and
> the SID from C64.

One thing I was always jealous of was the great amount of colours the Atari had.
Anyway, a few Graphicmodes on the C64 make extremely good resolutions and very colorful graphics possible. At least this calm my jealousy down a bit :-)
You should try to watch the demos "Krestology 1+2 /Crest" and "Deus ex machina /Crest" to get a good impression. "Deus ex machina" will be released in a few weeks I hope (at least DK/Crest promised that).
It was inroduced at the mekka Symposium Party 2000 (about easter) and won the competition.
Just have a look at http://www.scs-trc.net to get the files.

Oh yes I love to see messages like this. I have always said the 8-bit years were the best. I still believe that. Back then the thing was not improving the computer but improving the programs. You could buy a computer and not have it be obsolete in a month or two. Things were great with Bill to mess things up. That is why I still have and use my 400, 800xl, 130xe, 810, 1050 plus tons of software.

Being a child of the 90's, I have no coprehension of the days when the SOFTWARE was what you wanted to make more powerful, not the computer. I only know what it is like to buy a new computer once a year (which I do NOT, except for my Atari collection, not as expensive, ya know, and I keep all of my computers). It must have been nice to only have to buy a piece of software (though I am sure it was outrageously priced) to have a powerful and much more useful computer. I know the feeling to groan over a three year old computer in my high school's computer lab which takes forever to load Netscape, as compared with my one year old computer I have at home. Back in the day, as many of you put it, I don't guess you were spoiled by faster computers, but faster software. Then again, isn't it the software which makes the computer? Bill Gate$, you suck! Take Windoze and shove it (hehe :?)). I guess it had to come sometime, though.

On my 256k MIO, it always comes up as D6: and to format it, I first
deselect the printer buffer and then set disk type and size.

> For other users of the MIO, generally if you have a problem with the MIO
> keeping the
> drive information you have set the problem lies within the 50 pin cable
> from the Mio to the computer.

Often unplugging and replugging the cable will help and, though
it seems weird, doing the same with the SIO cable can help. The
problem is compounded on the 130XE because of the extra adapter card
needed to fit the Enhanced Cartridge Interface.

Also, a bad or flakey battery in the RealTime 8 can screw up the MIO.

My thoughts exactly. And the software wasn't outrageously
expensive, either. And, shoot, you could write almost any
application you wanted in BASIC, which took little time to learn
(and you could learn as you went.)

Waxing a bit nostalgic here, I remember when you had several
systems to choose from, and each had its strengths and
weaknesses. The Commodores were good sound and game machines,
the Atari was a good all-around home computer, the IBM PC was
for business and high-end applications, the Apple II sucked, and
there were other little companies that, although success varied,
had a fighting chance in the marketplace (Tandy, Zenith, Kaypro,
etc.) Nowadays, it's PC, Mac, or Unix. And with the Macs being
higher in price, Unix being a bit advanced for the average
schlep, and Billy Gates' *ahem* "marketing strategies", we know
who the winner is here. Maybe the Microsoft breakup will get
things back in order. Maybe not.

-=thE sUrReaL mONk=-

P.S. Does anyone know if Hasbro has any plans to develop new
Atari systems?

That's 'cos back then, computers didn't 'evolve' like modern PCs do. You didn't get a new sound card or video card or RAM upgrade or whatever 'cos the latest games needed them. There were such upgrades (or more accurately, hacks, as in the Gumby upgrade) available, but they were purely elective, and even then, generally only for the seasoned hacker. So, lacking upgradability, it forced programmers to use their imaginations, stretch the limits and boundaries of the 8-bit, find workarounds for the barriers they faced. That managed to produce some of the coolest stuff around.

These days it's not about pushing the envelope to make better games on existing hardware. It's about pushing the envelope to make better computers that work with existing games...

Rubbish.

I have a limited amount of brand new Atari Jaguar items for sale or trade.
These packages are ideal for new collector's or somebody wanting to start or
add to their Atari collection. If you have any questions, please feel free
to ask. I am also willing to trade for certain items, please see my list at
the end of this post. All prices quoted are in U.S. funds with the buyer
paying shipping.

If you are interested in any of these items, please respond to me by using
this automated link
jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.Jaguar (removing the
NOSPAM first). Or email me if you would like a current listing of items I
have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision,
Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex,
Microvision, or Handheld games) sent to you, (please specify system).

** Atari Jaguar Packages - Brand New (all contain one controller, RF Box and
AC adapter)**
==========
-.Atari Jaguar with CyberMorph cartridge and Composite Video Cable $50
- Atari Jaguar with CyberMorph cartridge $40
- Atari Jaguar (No Cart) $30

** Atari Jaguar Accessories - New**
==========
- Jaguar unit alone (No power supply, controller or accessories) $20
- Team Tap (4 Player adapter) $30
- Composite Video Cable $15
- Spare Controller $15
- AC Power Supply $15
- RF Switch Box $10

** Atari Jaguar Games - New/Shrink-wrapped**
==========
- Checkered Flag $10
- CyberMorph $5 (No Box)

Atari Force Comics Please make an offer
==========

All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for/towards rare or shrink-wrapped/sealed titles
for:
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- A working first generation Dish Network receiver
- A working 4000 series Dish Network receiver
- Working DSS H or HU Cards

You're not a geek. Last saturday I _finally_ connected my 8-bit atari
again (had to take it away afterwards though, because of lack of space)
and I played, believe it or not, my first ever bought game, Boulder
Dash, of cassette! And it stil worked. The tape is bloody 16 years old
(game of the year by that time). Waited all the 14 minutes of loading
time and it was, just like the old days, well worth the wait.

This would be my Revision B compy of Basic, Revision C does not give me that problem. Besides, I removed the screw from the back and could not crack the cartridge open. The "left cartridge" plate got in the way, and it must have been soldered to the cartridge bc it would not budge. Thanks for the "scientific" advice. Works fine if you have a soldering iron in your home.

I don't work at the post or anything, but I know that across the US it is about $12 priority, less if parcel post, so who knows with airmail (dare not ship VIA ground, takes weeks). That's just my 2 cents on the matter.

A 1050 shipping to Oklahoma would cost around ï¿½18 less the PSU. With the
PSU, it is too heavy to airmail.

Several. IIRC, you can find a few at the archive.umich.edu and maybe a Pascal or two.

IMO: They are only good for translating the simplist code or maybe the first two weeks of a programming class.

They are subsets of the C language and frequently have Atari specific calls to make them more useful. Kind of "There is no PMGraphics(2); in ANSI C" kind of thing.

Wally,
Revision B is what came with my Atari 800, so I had no choice for a while, frustrating as all get out, had to smack to use, then had problems when it was in use. Terrible program. For a while, I was using PET BASIC before one of my Atari friends gave me a copy of Revision C. PET Basic AKA MS Basic, was a little better than Revision B, but I got frustrated (again) when I discovered there are certain things that you can only do in Atari basic, or you mast change the syntax to use it in MS basic. UGH, was really glad when I got revision C.
Jessica

I just don't see why people say they have to buy a new computer every year. I was able to keep my '286 for more than five, my current Pentium 100 is about five years old, and will be netted to a new machine I plan to build in a month or two.

On the other hand, until I gave it up this past December to people who are still using it, consider the fact that my Atari system was bought in 1983.

On another topic, give the devil his due. Sure, Windows is cludgy, buggy, bloated, etc. But where else is there an OS that runs on the variety of hardware that Windows is able to use? Next time you look at Linux, which I admire for its stability and its open-code approach, take a look at the lists of hardware and peripherals that will and won't run under it. Or, look at the variety of hardware that can run under a specific version of Mac OS. Limited, isn't it? Finally, look at the problems associated with running an OS or software even for the variety of Atari 8-bit models. I think we just found one saving grace for Microsoft and Gates!

No! Don't Shoot! :-)

I don't have a solution but I admire the problem.

3311. How to tell which Atari Basic Revision that you have

Newsgroup: comp.sys.atari.8bit
Date: 2000-05-30 00:00:00 UTC
From: w_a_lang <w_a_lang@willinet.net>
Message-ID: <sj8l7mm75pj24@corp.supernews.com>
Source record: 44400

The memory address that identifies which Basic that you have is 43234.

So when you start your Atari up, at the READY prompt, type in this command:
PRINT PEEK (43234)

You will get a value of 162 if it is Rev A Basic.

You will get a value of 96 if it is Rev B Basic.

You will get a value of 234 if it is Rev C Basic.

Amateur Atari historian and Devout Atari game player,
Wally

I have two paths. I keep 2 current W/98 systems networked so I can see if there is such a thing as latest greatest, but from those it drops down to my circa 1987 Tandy 1000TX, 8 mHz 286. I really don't have anything in between.

My EPROM burner is still in the Tandy. As the saying goes, anything you could do with your computer when it was new, you can still do 10 years later. The EPROM burner works as well as ever.

The talk about extra ram got me to upgrade a stock 1050 to 256 bytes of 6810s. I plugged a USD ROM into it and it seems to work fine. I think I have ~4 different version of 1050 ROMs; Tandon EPROMs, Atari ROMs, maybe one labeled AWC but I have to read it first to make sure.

Problems that were interesting to me 15 years ago are still interesting to me now. Completely pointless, all my copy protected software has deteriorated or been tossed. A real drive will never work as well as an APE/SIO2PC, but it is a hobby.

>atarigirl1983@aol.com (AtariGirl1983) believes:

>Revision B is what came with my Atari 800, so I had no choice for a while,

Actually I do not believe Rev B was ever released on a cart which could be used
in the 800; It was on a chip internal to the 800XL, IIRC.

-Ron

I don't have a solution but I admire the problem.

It is the same as the more common General Instruments AY-3-8910 which
shouldn't be too hard to find on the surplus market.

Yes, here are a few that come to mind-

Native C Compilers:
Deep Blue C
DVC
LightSpeed C
ACEC C
CC8
C/65
CC65

Cross Compilers:
C65
CC65

All of them implement K&R to some degree. Some are better than others
in that respect. For more info check out-

On 28 May 2000 19:20:24 GMT, atarigirl1983@aol.com (AtariGirl1983)
drooled an embarassing wet spot in his lap as he typed:

>Being a child of the 90's, I have no coprehension of the days when the SOFTWARE
>was what you wanted to make more powerful, not the computer. I only know what
>it is like to buy a new computer once a year (which I do NOT, except for my
>Atari collection, not as expensive, ya know, and I keep all of my computers).
>It must have been nice to only have to buy a piece of software (though I am
>sure it was outrageously priced) to have a powerful and much more useful
>computer. I know the feeling to groan over a three year old computer in my
>high school's computer lab which takes forever to load Netscape, as compared
>with my one year old computer I have at home. Back in the day, as many of you
>put it, I don't guess you were spoiled by faster computers, but faster
>software. Then again, isn't it the software which makes the computer? Bill
>Gate$, you suck! Take Windoze and shove it (hehe :?)). I guess it had to come
>sometime, though.
>-Jessica

It wasn't so much that software got faster as the years went on as it
was that it software got _better_. Classic 8-bit systems weren't
upgradable in the modern sense of the word, so developers had to work
with what the machine was capable of. The upside to that was that
developers knew everyone had the same machine (more or less) so, aside
from RAM differences (16k 600KLs, 48K 400/800s, 64K 800XL/65XEs, 128k
130XEs, etc.) programmers could write anything they wanted within the
confines of the machine's abilities and know it'd work on everyone's
system.

The real cool stuff came about ironically *because* the system wasn't
upgradable. The machine's finite limitations forced programmers to
get creative with workarounds or hacks and tricks to get around
certain obstacles. Mixing graphics modes, using display list
interrupts to dynamically switch colour palettes every scan line (or
every few), overscanning, figuring out how to tweak digital sound
samples so a routine could be written to play them *without* having to
turn Antic off to get the most processor speed, etc.
Modern PCs don't get that because the modern programming ethic is that
if it's too slow, it's not their software, it's your hardware.
Coupled with software companies' lust for money and fast releases and
even faster ports, programmers just don't *have* to get creative
anymore -- so they don't. Which is a shame... 'cos I sincerely doubt
any modern PC has *ever* been pushed to its full potential. Or even
near it.

Just take a look at any demo coding group's efforts on classic systems
compared to mdoern systems. Sure, modern demos look much nicer, but
given each machine's capabilities, which ones are more impressive?
The PC demos that use hardware 3D accelleration, or the old demos that
didn't but still managed to achieve effects you never thought possible
on those little machines?

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

OTHER USENET NEWSGROUPS:

>
>The real cool stuff came about ironically *because* the system
wasn't
>upgradable. The machine's finite limitations forced programmers
to
>get creative with workarounds or hacks and tricks to get around
>certain obstacles.

What I find ironic is that an astronomically greater percentage
of households have computers now, even though they are far less
user-friendly and obsolescence occurs in a matter of months,
sometimes weeks, rather than in a matter of years. Can you
imagine what things would be like if other consumer products
follwed this trend? You'd buy a brand-new car, and in a year
would have to buy a new one, or severely upgrade your current
vehicle, just to accomodate the newest gasoline or faster roads!
You'd be buying a new stereo every year to be compatible with the
latest CD technology and higher radio bandwidth! And, hey, is
your telephone Y2K ready? Better bring it in for a $600 upgrade.

You have to wonder whether the public's lust for
bigger-better-faster will ever subside, at least as far as PCs
are concerned. Frankly, I think my 350 MHz, 64M Ram, 10G HD, 4x
DVD-ROM, and 17" monitor is more than enough for what I need to

do. I don't know WHY we need a 1 GHz processor, but I'm sure the
software companies' Marketing dept.'s will tell us why. Don't
know what we ever did without them...

The memory address that identifies which Basic that you have is 43234.

So when you start your Atari up, at the READY prompt, type in this command:
PRINT PEEK (43234)

You will get a value of 162 if it is Rev A Basic.

You will get a value of 96 if it is Rev B Basic.

You will get a value of 234 if it is Rev C Basic.

Amateur Atari historian and Devout Atari game player,
Wally

I still compute till I passout. My wife thinks it's cute.

> Sorry to sound like a geek, but I've been in Bill Gates' world
> for quite some time, and now I've been reminded how computers
> OUGHT to be!

Yes, I agree, the Atari 8-bit line is a fun and sleak computer. Use it for
checking E-mail localling, BBS'ing, playing games. Much much fun to be had.
And Star Raiders is still the best of the all. Set up a section of the house
dedicated to being a Star Raiders flight simulator.
As far as the windows world... never bought into that for my home. Managed
to skirt it with my Atari8,AtariST,Macintosh, & Newton. ;)

> P.S. If anyone here is selling their old 800, drop me a line.

Lot's of luck! Atari 800's can take a bit to find. But well worth it when
you do. In the mean time, you can gear up with an Atari 800XL... usually
fairly easy to find.

3333. Creating Atari disks on PC

Newsgroup: comp.sys.atari.8bit
Date: 2000-05-30 00:00:00 UTC
From: Chicago_Consultant <terrapin42NOteSPAM@hotmail.com.invalid>
Message-ID: <17d7a6cc.fd66f237@usw-ex0103-023.remarq.com>
Source record: 44494

Okay, now that I have an emulator, I need to know how to create
virtual Atari disks and copy files from my hard drive on to them.
Is there a utility available which can do this?

Hi,

I am looking for a functioning ATARI 1050 DISKDRIVE to connect with my ATARI
800 XL.

Can someone help me!?

I live in the Netherlands.

Hope to hear from you!?

Mark

Yes there is yes. I have such a program for my Atari clone computer.
For PC computers I believe the program is called APE.

>
>You have to wonder whether the public's lust for
>bigger-better-faster will ever subside, at least as far as PCs
>are concerned. Frankly, I think my 350 MHz, 64M Ram, 10G HD, 4x
>DVD-ROM, and 17" monitor is more than enough for what I need to
>do. I don't know WHY we need a 1 GHz processor, but I'm sure the
>software companies' Marketing dept.'s will tell us why. Don't
>know what we ever did without them...

But then we come to the question of whether it's the public's lust for
bigger-better-faster-more, or whether it's the market that force fed
the public new technology *creating* this lust. Creating markets is
nothing new. Microsoft practically pioneered it. Look at their tech
support department. Thousands strong, making money by the truckload,
and overloaded with people having problems paying through the nose on
a per-incident basis for help. Why? Because Microsoft couldn't write
a useable manual if their very existence depended upon it -- and they
don't _want_ to. Why should they, when their tech support department
brings in untold riches?

Granted, bigger-better-faster-more brings with it additional
complexity, which itself brings more confusion and less user
friendliness because there's so much more you have to learn to get the
most out of it. But consider this: strip away the fancy graphics and
environmental audio sound to its bare essentials: video and audio.
Strip away all those "labour-saving" shortcuts and tips. Get rid of
the superfluous fluff that most people don't use, and never will. Now
take what's left and ask yourself if you could do it on your old
Atari. How many "yes" answers did you come up with? Now ask yourself
if Windows is all that and a bag of chips. Maybe you don't have to

type as much. Maybe you are presented everything in a graphical
manner instead of a more abstract WYSIWYG style.

But then, maybe we're not as dumb as we look. Not that Microsoft
wants to believe that. (Everybody say it with me: "Microsoft BOB!")

>running an OS or software even for the variety of Atari 8-bit models. I
>think we just found one saving grace for Microsoft and Gates!

I don't know about that. How much of Windows are you going to use? I
mean, taken as a whole, how much of it could you eliminate without
losing any useful functionality that you need or want? Okay, now
that'll vary for everyone. Myself, I use a lot -- but then, I also do
a lot. 3D modelling, lots of artwork, word processing, DTP, emulation,
music composition, and lots of other stuff that requires tons of stuff
laying about to be used at one time or another. I guess I'm what
you'd call a power user. But I could still strip enough of this
bloated whale away to make a whole new OS.

Now, maybe I couldn't have 900+ fonts on my 8-bit. Maybe I couldn't
emulate synths, make MODs/XMs, or do 3D rendering on my 8-bit, but
that's a product of the machine's era -- few people did in those days,
and those who did usually worked for big production companies or
special effects houses in Hollywood. Point is, it's easy to look
backwards and say, "That machine could never do what mine does now!"
But back then we didn't even think about alternate operating systems,
digital music composition, 3D modelling, or any other such modern
concepts. We didn't think about them because for the most part, they
didn't exist, and no one had thought about them yet. But what we DID
need and want to do was still possible. Simpler needs and wants,
certainly -- for simpler times. But what I'm trying to get at is, is
it all *necessary?* Do we NEED to support 40 different video cards,

60 different sound card manufacturers, millions of types of monitors,
modems, keyboards, printers, scanners, and a host other peripherals?
This glut of manufacturers needlessly complicates things and are what
make the PC scene such a confusing and often frustrating mess that as
often as not causes more calls to tech support centers than could
possibly be imagined.

Back on the Atari -- or pretty much any platform -- it didn't matter
who made your peripherals. You plugged them in, and they worked.
Simple as that.

These days, plug and pray isn't just a smart-ass remark.

Hey,
A bit of advice: look on eBay, I have seen several of the 800's up for bids. The prices are terrible, one is up with 3 810 disk drives, interface, and programs for $80. I bid on it myself, when the bid was at like $10. Call me cheap, but I bid $60 on it. Oh well, am getting 3 800XL computers, 1200XL, 1050, 850, 1027, 410, and a 1010 for $60. So, I can see what some of my fellow posting friends mean when they are hard to come by. A bit of irony- got my 800 at goodwill with cables, pac man, space invaders, and basic (revision B, ugh) for $10. Kinda sad that people do not look around for the best deal. Anyway, good luck my man.

>I don't know about that. How much of Windows are you going to use? I
>mean, taken as a whole, how much of it could you eliminate without
>losing any useful functionality that you need or want?

I hate windows because of internet explorer, cookies, and MS word. I like windows because of the other things I can do. My mom and I have a business to run on eBay and I could never do that on an 8bit. Tell Bill Gates to buy a vacum or sweep up his crumbs and we will be on OK terms. And why does windows have to be so annoying?

Okay, now
>that'll vary for everyone. Myself, I use a lot -- but then, I also do

You know, remember when MS DOS came out and there were all these minor upgrades
that were expensive. Most of us could still not figure out how to use it.
That's how little Billy got his money. BTW, I may be 16 but I remember DOS.
Kinda hurt my little hands to be pressing the F command keys all the time.
After all, I was 5.

:-) I remember DOS as if it was yesterday.

Er... actually, it was. I still use DOS for stuff that Windows is too
sluggish or too annoying to do. Plus, once I outgrew DOS 2.5, I went
with SpartaDOS and was forever a CLI convert.

Of course, back then I completely ignored the IBM-type machines.

On 31 May 2000 06:16:12 GMT, atarigirl1983@aol.com (AtariGirl1983)
drooled an embarassing wet spot in his lap as he typed:

>I hate windows because of internet explorer, cookies, and MS word. I like

Word is good, but bloody slow. (Word 2000 is anyway) I never use IE;
I use Netscrape, which has its own problems -- but it's not made by
Microsoft, which is the important thing. :-)

>windows because of the other things I can do. My mom and I have a business to
>run on eBay and I could never do that on an 8bit. Tell Bill Gates to buy a
>vacum or sweep up his crumbs and we will be on OK terms. And why does windows
>have to be so annoying?

Probably because its developers are annoying. :-) And sure, maybe
web surfing is beyond the realm of the 8-bit -- but then, the web
didn't exist during the 8-bit's reign, and the Internet was still
something used primarily by university students who poked around in
Unix.

As for Bill's crumbs -- he'd need one hell of a powerful vaccuum and a
mint in bags... :-)

>You got it. I use my PC for everything except for using the toilet, it seems.
>But, I am leaning away from my PC as I have discovered the 8bit system.

I guess you could literally say I started with the 8-bit when you were
still in diapers. :-) But it's always held my attention, and I try
and keep up with the latest in 8-bit emulation (for lack of a real
8-bit system). I still prefer that simpler machine... the games were
more fun to play, the environment was simpler, and overall the machine
had a kind of magic to it that doesn't fade over time...

>Get a printer interface, man. Makes pretty, unusual fonts.

I had a P:R: Connection and an SMM801 printer back in the day. Noisy
bugger, it was, and it was used primarily for printing out my BBS log.
:-) Didn't have any funky fonts in it tho... it was yer basic, 9-pin
Atari dot matrix printer.

>Nope, many of them don't do anything different than their competition.

Which is my point. Some of them are vastly inferior -- my boss got me
a new computer to play with at work, and it's a major cheap-ass piece
o' garbage. Celery 466, crappy SIS 3D video card that only does D3D
(when all the games he wants to play on it are OpenGL or Glide),
no-name sound card -- cheap components all around. They could all
safely (and mercifully) be eliminated as far as I'm concerned. Keep

the decent manufacturers around -- a handful, and things would be a
whole lot less annoying in the PC world.

>And if they didn't, you could always drop them three feet off the ground and
>the dust would come loose :)

Or play shotput. Back in the day, the XM301 modem (that ancient 300
baud wonder) was also known around my area as the "hammerball" 'cos
when it stopped working (as it inevitably would) you could grab it by
its SIO cable, swing it round your head and see how far you could toss
it. :-)

>>These days, plug and pray isn't just a smart-ass remark.

The IBM's were the only ones I was refering to. I used SpartaDOS yesterday, too.

3347. Computer Eyes for Atari 8-bit

Newsgroup: comp.sys.atari.8bit
Date: 2000-05-31 00:00:00 UTC

Does anyone know anything about Computer Eyes for Atari 8-bit? I have a bid on one at eBay. Looked intriguing. Here is what I don know about it:

Similar to a digicam
In B/W
...and that's about it.

If anyone ever had or has one of these or knows anything about one, let me know as I would like to learn more about this as I am in the market for one.

> 60 different sound card manufacturers, millions of types of monitors,
> modems, keyboards, printers, scanners, and a host other peripherals?

A very good question. One I think every computer user must ask.

I remember being in college and the computer science folk were working with upgraded 386 computers. Meanwhile, the guy down the hall that only wanted to play games and word process had a powerful 486 computer. We thought to ourselves, what a waste of computer. ;)

Getting bang for the buck... I can see if a person wanted to get a powerful PC over an Atari Hades clone for much less the price. However, if all I wanted to do was check E-mail, and I had the choice of a low end PC or ST for $5... guess which way I would go. :)

And is it worth spending $1000 for a computer. Do you get bang for the buck these days? Will a computer continue to be useful long enough to make it worth it?

> This glut of manufacturers needlessly complicates things and are what
> make the PC scene such a confusing and often frustrating mess that as
> often as not causes more calls to tech support centers than could
> possibly be imagined.

I think computer companies make it neccessary to have tech support around. Makes for a booming economy and more jobs. For this I'm happy that 90% decide to live in the PC world. Not that I would. ;)

> Back on the Atari -- or pretty much any platform -- it didn't matter
> who made your peripherals. You plugged them in, and they worked.
> Simple as that.
> These days, plug and pray isn't just a smart-ass remark.

Macintoshs are pretty much plug and play. But then you pay more for it. In my opinion, worth every extra bit.

I've always been a gamer. But then I also do all kinds of other
things on my machine, too, so I tend to get the most out of what I
have. Not that an upgrade wouldn't be nice...

>
> Getting bang for the buck... I can see if a person wanted to get a powerful
>PC over an Atari Hades clone for much less the price. However, if all I wanted
>to do was check E-mail, and I had the choice of a low end PC or ST for $5...
>guess which way I would go. :)

True enough. But for me, I want a system I can grow into. If I get
an overpowered system, it may be a waste for what I'm doing _now_, but
I *always* manage to find ways to get the most out of the system
eventually. This P166/MMX -- the first PC I ever bought and still own
(though there are very nearly no original parts left in it anymore)
and use, was more than enough at the time that I bought it (two and a
half years ago), but I've long since exceeded its capabilities and
need to upgrade at some point.

On the other hand, my dad, who's just now getting into computers, has
the same system as I do and it's WAY more than he'll ever need for
quite some time to come. Presently for him, it's something to
practise on, and something to learn to type on. :-)

> And is it worth spending $1000 for a computer. Do you get bang for the
>buck these days? Will a computer continue to be useful long enough to make it
>worth it?

Depends on what you use it for. Whenever someone asks me what sort of
computer they should get, I always ask them what they're planning on
doing with it, then tell them what they should get based on that. No
point in getting them to go out and by a PIII-800MHz coppermine when
all they want to do is surf the web and word process. But if they
want to do 3D modelling, animation, high-end gaming, running a LAN,
etc. then I'd tell them to get something high end.

It's all in what you do with what you have that determines its worth.

> I think computer companies make it neccessary to have tech support around.
> Makes for a booming economy and more jobs. For this I'm happy that 90%
>decide to live in the PC world. Not that I would. ;)

I got a PC simply because it's the most widely supported and stands to
survive a long time, in spite of its kludginess, backwardness, and the
fact that it has Bill Gates running the show. Having long been a
staunch and outspoken supporter of Atari and watching the Tramiels let
me down time after time, I figured it was time to move on to something
more genuinely supported. I've never really liked Macs tho... call it
a personal preference.

> Macintoshs are pretty much plug and play. But then you pay more for it.
>In my opinion, worth every extra bit.

True, but for the longest time Macs were that way because the only
manufacturer of Mac peripherals was Apple, 'cos Apples used
non-standard ports. The standardization of their ports was a smart
move for Apple IMHO and garnered them some additional popularity.

That's all it really is. It's an image digitizer that can capture
still images in graphics mode 9 (16 fixed grayscale shades, 96x192
resolution -- I think that's what Gr.9 was. Same as mode 11, but mode
11 had 16 fixed colours)

I agree. My mother is looking for something very powerful for she is a college
teacher and she is beginning to teach online courses. That requires a fast
processor and something that can handle javascript well. However, I just
basicly type, do DTP, surf, etc. on my PC (sometimes not even that, I just save
the high tech stuff for the PC, the simple stuff for the Atari), so I would
need just a simple computer. The Atari fits that category, though it does not
have net surfing capabilities.

>I got a PC simply because it's the most widely supported and stands to

Exactly why I got one, other than I needed it for school, being one of my high
schools' tech nerds. I am just about required to build a web page once a week

when school is in session, esp. when I am in a computer class, like as in one each semester. Required for my "major" in high school so I can graduate. Some stupid thing Kentucky instituted for all students. I also got a PC because I did not know anything about old computers at the time, other than MS DOS :)

>True, but for the longest time Macs were that way because the only

And, the iMac, whic has inspired just about every other electronics company to make items with fruity colored shells. They even have mouse covers and buttons so that you can have a colorful mouse, scanner button covers, and a lot more things that are utterly useless. Obviously, compatibility has something to do with it, but Apple knows that it helps to be cute :), sadly.

I frequently get called upon by members of my Atari user group to "fix" their Windoze boxes. Probably 70-90% of the time, DOS saves my butt when it comes to finding lost files etc. If I get called upon to work on an ST, the first thing I do is grab a CLI from the club library, whichever one can best emulate MS-DOS.

Wouldn't you just love to see some of SpartaDOS' innovations in MS-DOS?

I'd say you do get really good bang for the buck today. My first computer cost me $1000 (Canadian) back in 1979. That got me a 16K TRS-80 Model 1 with a really cheap cassette deck and a black and white monitor that was essentially just a cheap portable TV without a tuner. Adding a floppy drive would have cost somewhere around $800 more.

The problem with today's computers is not the value they provide but rather the sales job done on people who have no real idea of what they "need" in the way of capability and performance. Sort of like a bunch of people in a retirement home being sold Ferraris to use for weekly grocery shopping.

Although I am not, nor have I ever been, a Mac user, I
personally think the iMac designs are quite awesome and
innovative. Geez, that was half of Atari's appeal -- they had
some of the best-looking boxes in computer history! From the
early 70's through the 80's, Atari machines drew people in from
their great architecture and artwork. Set your browser on
www.atari-history.com and check it out yourself... wish I could
get my paws on an old Computer Space machine, or an AtariTel
video phone that never made it to the market.

Nothing new to me. It is just that MS Dos is so hard to understand, and if you do not know the filename to open, you have to be psychic to figure it out, in my MS DOS experience anyway.
Jessica

P.S: BTW, the ONLY DOS I am refering to is Microsoft. Every other DOS I have used has been fine.

I hate Windows and PCs, period. I got my 800 in '83 precisely because at the time, the PC was very overpriced, extremely limited sound and graphics wise, and there was nothing even remotely creative being done with them. The 800, on the other paw, was precisely what I was looking for in a computer. :o)

Atari 8 bits not being able to surf the web? Whoops, I'll have to tell my 130XE that it was hallucinating when I was surfing the WWW with Ice-T, and telnetting to a Sun Microsystems site to use Lynx. No graphics or sound, but it was definitely on the Web. One can even download things via Zmodem, and before I got this Amiga, it was my only way to get on to the Internet. I processed all my email with it as well. My Amiga 2000 030/25, by the way, is my second most powerful system (the 4000 is the first, but it is currently broken), and at 12 years old, is one of my newest systems as well. I still see no need at all to go PC, especially when a G3 accelerator is due to be released. If I need Java, or some other newfangled feature, I'll just install Linux or emulate a PowerMac. Or install the new Amiga OS, if it ever materializes for my system.

I see no reason to emulate an 8-bit, when the real thing is soooo much more stable and preferable. <grin>

Actualy I never had any problems with 3.1, its when the bloat started that
i started having problems. I now treat windows like an atomic element, the
bigger/heavier they are, the more unstable they are. Currently waiting to
see if windows millenium will be the melt down.
Thats why I play games on my Atari and my Amiga, and the nostalgia feeling
is also great. After all, many of these games were loud, trashy, fun, easy
to play but difficult to master, what more do you want? I work with PCs
all days, so the change is also good. Half Life may be great, but it
keeps crashing on my machine (bad display card?). I have played M.U.L.E.
and Zybex much more that any game over the past few months, and shall
proberbly continue to do so for some time. But gulf strike and powermonger
are looking at me menacingly from the Amiga shelf, And I only got the
amiga 'cause it came with the 1084 monitor I bought for the 130XE.

Just my few pence worth

> > along the lines of the C128. The 7800 was a true graphical marvel.

I have spent a little time comparing the C-64 and Atari and the list I came
up with was:

- ANTIC (Much better... DLI's are clean and easy, and all those graphics
modes)
- Colors (Hands down the atari wins...)
- Clock speed (Yes I know that in some modes the difference is marginal,
but it exists)
- Basic... Atari basic is much nicer than the basic that shipped with
the 64. You can actually access many different graphics modes without
using
pokes...

The C-64 had the following advantages (As I see it) over the Atari 8 bits:
- Sprites (They beat PM graphics hands down)
- SID (Sounds much nicer usually)
- Multicolor Character modes. I've wished many times that I could just
do a (Poke CHARADDR+4096,SOMECOLOR) (4096 is an offset to the
palette for each memory block). In the style of the C-64/ Ohio Scientific
C4P/ Heaps of other machines.

Disk drives:
Sorry guys! I have to disagree with y'all here, Both the C64 and the Atari
transfer rates for disk drives sucked eggs. My first machine was an OSI
C1P. It loaded files faster than lightning. It used a parallel interface
and
the standard drives used MPI drive mechanisms with fast step rates...
The atari (And commodore) seemed dog slow in respect.... Why you would
hang a drive with a 150000 bps MFM (Is that right or was it M2FM) on
a serial bus and clock it at 19200 bps eludes me...

In summary I would add that the Atari and Commodore are capable of
different genre's of games and both perform in that genre fairly well.

Sprite based games are great on the 64... (Try porting to PM graphics...)
3D games are much better on the atari... Look at any of the Lucasfilm games
for proof.

As for Archon... I had the most fun playing another person at that... The
visual
differences didn't matter a hell of a lot to me... either on the Atari or
C64 versions. The fact that the other person I was playing against managed
to toast
my <Higher power> character with one of those slashers/pole guys did :-)

Now for a question:
How does the 7800 video hardware compare ? Does anyone have a URL ?

Cheers
Pete

The fact that 3.1x was so stable was that it wasn't a true OS (as
previously discussed in another posting.) Microsoft had MS-DOS
down pat (as much as you all hate MS-DOS, it was the best OS for
PCs). MS-DOS was stable, and so anything that worked on top of
it was equally stable. I haave to say I miss Win 3.1... a bit
quirky, but was pretty frill-free and got the job done.

And WHAT THE G#%G35!F#@? IS UP WITH WIN 98??? All it is a less
stable, more space-hogging, more unnecessary bells-and-whistles
version of Win 95. It's the biggest scam I've ever seen
perpetrated on the PC community yet. Are there ANY happy 98
users out there? I didn't think so. I use a dual-boot
Win95/Win2K, and would never let 98 touch my hard drive!

I think I'm going to go crawl off in a corner and pretend it's
1982, and I have my Atari 800 once again... ah, fantasy...

I update my catalogs once a week. Just before this message is posted. So when you see a new posting, check my Catalogs. After I post this message. I'm off for the weekend. But I'll be back after the weekend.

e-mail: atari@benjamin.net

To take advantage of Discounts or FREE Monitors or FREE Jaguar Video Cable, you must E-Mail me to Claim it & state what you want in E-Mail.

Discounts! Buy now! 5% Discount with a $50 Purchase. 10% Discount with a $100 Purchase. 15% Discount with a $150 Purchase. And a 20% Discount with a $200 Purchase. Discounts Apply to Classic Atari 8 Bit, Atari ST and/or Atari Jaguar. Hardware, Software, Books & Accessories! Shipping not figured into Discount. Customer pays Shipping. Limited Time offer! Substitutions considered.

FREE Monitor with Atari Purchase! Buy either an Atari 1040STF, Mega 2 ST or a 1040STe and receive a FREE Monitor. Your Choice of a Color or MonoChrome Monitor. FREE Monitor when purchasing an Atari 8 Bit Computer. Buy an Atari 800XL or an Atari 130XE and an Atari 8 Bit Disk Drive such as an Atari 1050 Drive & receive your choice of any Monitor in the Atari 8 Bit Hardware Catalog. And FREE when purchasing $50 of Atari Jaguar items, receive absolutely FREE, a +NEW in BAG Jaguar Composite Video/Stereo Audio Cable. Offer Available for Limited Time only. First Come, First Serve! Subject due to availability! Customer pays all Shipping! Substitutions considered.

I've added more and will be adding more Hardware, Software, Books and Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out into Atari Jaguar Hardware & Games. So checkout what's new on my Web Site. In Fact, check it regularly as my Catalogs are updated regularly. Customer's are served, first come, first serve! No competing in auctions. Just Sales, Support & Service! I have 8 different Catalogs, & my SoftWare Catalogs are my largest. They have the biggest Byte Count. You should see my inventory! I have TruckLoads of HardWare, Boxes and Boxes of Software & Libraries of Books & Reference Material for the Classic Atari 8 Bit, Atari ST & Atari Jaguar Game Machine! And remember, if you can't come see me today, come see me tomorrow!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari 64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump to my FTP site linked to my WebSite so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor & view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or bensmith@teleport.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

Hey, I never said the design wasn't awesome. I wish they could put an atari in
that cute of a box! I agree about the sleek design of the 8 bits, very cool
for the day, klunky like a typewriter now, esp. 400/800. Not to say that it
isn't cool, but an 800 XL and the 10-products are vey sleek, even compared to
some modern machines.

3381. Of Disk Drives (Again)

Newsgroup: comp.sys.atari.8bit
Date: 2000-06-01 00:00:00 UTC
From: Hall/Dobson <soba@istar.ca>
Message-ID: <UsrZ4.10058$lp.321322@cac1.rdr.news.psi.ca>
Source record: 44436

I posted a message a couple weeks ago asking for help with malfunctioning disk drives. (The thread has since vanished.) Anyway, there were a couple of responses (for which, thanks), suggesting I try cleaning the heads. I did this but to no effect. As far as I could see the heads looked clean, and there was no residue or discoloration on the swabs after cleaning. (Would it be otherwise if they were dirty?)

I discovered one of the drives had a broken drive belt but the others (several 1050s and an XF551) remain inoperable for unknown reasons. None of the drives will boot or read data from a disk even though the disks rotate and the heads move. Any more suggestions? (The drive select switches are correctly set, and I've tried using both I/O ports on all of them.)

Also, of my two working drives the speeds are way too high, 344 for the 1050 and 358 for the XF551. I watched a tech adjust the speed many years ago and thought, Hey that's pretty simple. There was a screw he turned and that was it. But now I can't find the blasted thing. Anyone able to point me in the right direction? (I have some simple BASIC programs that will check the speeds.)

As always, I'm grateful for any help.

Ed

XF551s have weak boards, and these can crack with little hairline
cracks.

Still doesn't put me off wanting one though ;)

Since you tried so many drives, maybe try another computer ?

NOT SO!

Use SpartaDos to get started, then take the A+ course (about $2900) for the rest :-)

Well, perhaps all of that will change with the anticipated growing
popularity of so-called Web appliances.

Something rather interesting came up lately, BTW. Seems that AOL and
Gateway have invested heavily in such an appliance, which will use a
non-Intel processor and a modified Linux (maybe a subset) as an OS. The
machine will have no hard drive, and should be ideal for non-geeks.

But what's interesting to me, aside from the disertion from the classical
Wintel is the fact that that processor runs cool enough to not need a fan.
I have no idea of its speed.

At any rate, the device will sell for <$500 to start, and the way things are
going, will probably get cheaper, smaller, and smarter along the way. That
should satisfy the people who don't want, need, or can't learn to use
computers and make tons of money for the marketers in the process.

Not quite. MS weren't *that* big until Win3 and more notably Win3.1 came
out. Then it started to become the huge monster we see today.

It wasn't bad for its day, it just overstayed its welcome a bit ;-)
Microsoft bought in MSDOS from the Seattle Computer Company (and don't they feel sick about it now..)

In fact, MS buy in vast amounts of their stuff including Powerpoint, IE and I'm pretty sure Access too.

It takes quite a bit of fiddling and I will probably omit a few things.

But take the cover off the drive, first boot it w/o the computer attached.

If the track zero sensor is bad, the head will march accross the disk on
every boot, but never return to the outside. With the computer attached,
turn on the computer which will poll the drive and listen for I/O sounds.
Track zero sensor will have the same stepping across the disk problems with
cycling the power on the computer as it did cycling the drives power.

Watch the rotation of the disk under both set ups. If the drive active LED
lights up and the disk isn't rotating, then it is a problem with drive motor
or most likely a fault in the 12V power supply. They used a voltage doubling
circuit in the 1050 and the diodes in it overheat and break loose.

Since the drive is trying to spin up, that means its RAM, ROM, and processor
are probably OK.

Since you are getting a value for RPM, that is a good indication that the
serial I/O is working fine, i.e. good 3086 transistor array and probably
6532 and controller, but that speed is really disturbing.

A properly adjusted 1050 is 288 RPM and an XF551 is kind of hard wired at
300 RPM, I have never even heard of an XF that needed its speed adjusted.

Kind of odd that both the 1050 and XF are both off by the same 60 RPM don't you think? This really makes me think the problem is not with the drives, but maybe a funky disk or POKEY chip in your 800. I think I have only had 2 POKEY chips go out in the last 15 years, but they do fail and some seem to be stronger then others.

But if it was me, first thing I would do is get a fresh disk and try formating it in the drives.

And to think these weren't even stand-alone OS's. It took
Microsoft until 1995 to have a standard GUI OS (NT was earlier, I
know, but was hardly a standard in the PC world), when Apple
released the first in 1984! Why the PC world didn't flock to
OS/2, I'll never know.

On Thu, 1 Jun 2000 23:45:04 +0100, Edward Scissorhands
<EdwardS@lovecraft.demon.co.uk> drooled an embarassing wet spot in his
lap as he typed:

[...]
>Nothing like this happens now. There's no disparity between machines,
>like a BBC B having excellent sound and poor Sprites, or Sinclair's
>machine with appaling graphics and sound still managing to steal a large
>chunk of the market. There's no excitement.

Naturally. All of the excitement has been burried deep by rampant
confusion over which sound or video card is better than the others,
which ones are compatible, what processor to buy, how much RAM, what
motherboard, case, various peripherals, monitor, and so on. As if
that weren't enough, there's Windows to add to the confusion and
frustration of the PC platform. That in itself is an entire set of
volumes worth of dross. It's hard to get excited about anything when
you're busy working out how to work the bloody thing without GPFing or
watching Explorer up and spontaneously die on you. Then, too, you
have the general failure rate of modern hardware. (The "They don't
make 'em like they used to" factor) I bought my PC two and a half
years ago. Since then, it's been outdated roughly twenty times, two
hard drives have died, my motherboard blew a circuit, and my monitor
curled up into a fetal position and sucked its thumb. The motherboard
and monitor were under warranty so I had them replaced. The hard
drives were at my expense -- I'd had enough of dealing with the
distrputable fellow who, while replacing my stuff well enough, didn't
disabuse me of the notion that he shouldn't have to be doing that in
the first place.

Excitement? The most excitement I get out of my PC is when I learn a
new version of Atari800Win is out.

>Only one computer at the time could seriously rival the Atari,
>technically, and the Enterprise was a failure.

But slick looking. If they got rid of those damned red and green keys
and the built-in joystick, that thing would have been the sweetest
looking machine in existence. Notebook-thin, jet black... kind of
like the NeXT-Cube's little cousin twice removed.

>For all that they should have done, Atari did everyone pretty good
>service with the 8-bit range. They got it right first time and it's
>still a pleasing machine to use, well made, well designed and even, in
>the case of the XEs, quite modern in design.

I loved all the 8-bit machines I owned, from the 600XL up to my (at the time) monster 320XE. I still regret getting rid of it all those years ago. Particularily the programs I wrote which probably never made it beyond the local BBSes I uploaded them to. They were crap, but they were *mine!* :-)

>Sinclair QLs, and reading spec sheets and old reviews to see what
>computers I had missed out. (Memotech RS128, Coleco Adam, and MSX 2
>stuff).

I'm doing all of that -- but through the miracle of emulation. I'm learning about all the classic machines that I'd never even heard of. Back in the day, my world was Atari, and the only other machine in existence worthy of calling direct competition was the C64. The only other machines were Commodore's older offerings, the Coleco ADAM (which I must admit to wanting before I got my first computer), and the Timex-Sinclair ZX81 -- which wasn't really competition for much more than a scientific calculator. The first I'd ever even HEARD of another 8-bit machine was when I got a Speccy emulator on my Atari ST and began revenously collecting SNAps. Now I'm learning all about the BBCs, Amstrads, Sinclairs, Memotechs, and so on down the lines. It's great fun to see what I missed out on -- but none of them will ever compare all the many, many months I spent playing the Alternate Reality series on my Atari. Or M.U.L.E., or Seven Cities of Gold, or the Lucasfilm games, or...

Does it really matter what type of processor, ram, etc? It is so confusing! Simplicity is power. As the itallians say, "What can I take away to make it better? What makes this the way it is? Emphasize that aspect." Today's computers have so much junk on them that they don't need, therefore comprimising the power and charecter of the PC, and of course, the simplicity.

>As if
>that weren't enough, there's Windows to add to the confusion and

Try deleting explorer completely from your system so that you can switch over to Netscape. Can't do it! And, for one, Microsoft creates too many updates. Sure, it looks nice and can do a little more than a potato, but why pay $200 for a new version of windows? Just so that your computer can crash (esp. if your isp is AOL)? Is it really worth it?

>Then, too, you have the general >failure rate of modern hardware. >(The "They

It is frustrating to keep replacing parts on your PC. I had a really cheap modem in my PC. I have had my Cybermax PC for less than a year and have had to replace the modem twice. The last time it broke, back in October, I finally replaced it with a US Robotics 56K modem and it has worked ever since.

Last month, Windows decided to crash for three days. I went through 5 boot up disks until a friend gave me one she KNEW would work. Sure enough, it did, but this is really crazy to go though this much of a mess to fix a computer. They don't make them like they used to--yep!

>Somewhere, high up on a lonely shelf deep within the recesses of
>Hasbro Interactive HQ, a stack of papers all bearing Fuji symbols

>than the current fate of CBM! :-)

Atari needs to return to its rich computing heritage (sounds kinda hokey, don't it?). Why don't they make a PC? I am sure if they get the right programmers, they can succeed. They should make it durable like an 8bit, "powerful" like a modern PC, connect it to the net, but yet come up with creative design and layout. If they do (which I doubt) I will be on of the first in line to get it. I'm not asking for it to be a clone of a modern PC, but get the power and strength and charecter in one machine. Nice dream, huh?

Yep, WIN 98 is that, too many bells and whistles. I just have WIN 98 because that is what came on my PC, but that doesn't mean I don't hate it. What you said about MS DOS: Stable, yes, but still complicated. Get a menu, for god's sakes! Give me some way to find the filename of a program that I do not know the filename of!

As for crawling over into a corner, that sounds nice but I can't really do that without entering a former life or something. I wasn't even concieved in 1982. But still, it never hurts to pretend...

I never knew that I could serf the web with an 8bit. Just out of the question since one of my friends had a Mac Classic from 1993 that she tried to get on the web, but the local isp cracked up (as in HAha crack up {funny}, not disenegration). This was in 1996, maybe things have changed, become more accomadating for us Atarians.

Why all the Microsoft bashing? Because they do what they do well?
Confusion and frustration? I'm sorry, but Windows is the easiest OS to
install and use out of every OS, and yes, I have had my little problems with
windows, but in comparison to other OSes, it runs GREAT.
And Nestcape? hah! Microsoft IE is FAR superiour on every level. Netscape
rarley displays web pages properly... load a page in Netscape and then try
the same page in IE and you'll see how it's supposed to look.
I think alternate OSes are neat, and I had linux on my old PC, but when I
tried to install it on my new PC...not gonna happen...no AGP support...no
ethernet unless I recompile the kernel or link in a Deamon, etc...
Windows? Installed perfect in 15 mins... (I know newer distros of Linux have
support, just making a point)

Updates are a good thing. Bug fixes n stuff. You may argue that there
shouldn't be bugs, but..have you ever tried to program? There will always be
bugs... At least it works and is up to date with the latest hardware..
Windows does have the benifit of having vendors write drivers...I'll admit
that...

It was interesting for a little while, but all the graphical web browsers kind of made it tough to get around now. A lot of people don't even offer shell accounts anymore.

This is one of those "Walked 20 miles to school in the snow while barefoot" kind of stories, so you are welcome to ignore it.

But circa late 80s-1990 I did everything via a shell account. Typically connected to Portal<it had its own weird interface> or netmagic and read news with rn, tin, or pine. I would FTP to archive.umich.edu with I *think* a 386SX I was using at the time to get atari files, then phone back with my Atari and download them at 2400 baud.

There were several times in my life where technology was "magic" to me.

When I built my first crystal radio set in about the 5th grade.

When I built my first home brew computer ~1977 it was based on the Radio Electronics 1802 articles.

First night I built my illegal HBO 2 gHz downconverter out of a coffee can and watched free HBO<Alien was the first movie> with the TV set sitting on my dryer and me laying on the floor of my laundry room: I needed line of site to the transmitter.

The first time I connected to a bbs with an Atari at 300 baud.

When one of the people in my user group turned me on to the internet. The magic was the first night I figured out ftp get and put.

FamilyNet HQ: Telnet:\\www.family-bbs.net

Larry,
I have found the best way to get on the internet with an Atari 400/800/
..etc... is to use Bobterm or Ice-T terminal programs and then log on either
through a local dialup BBS with telnet access (rare) or try using the SIO2PC
Ape interface software by Steve Tucker. Some great advances going on there.

>was suit was meaningless because Apple copied Xerox...
>
1979 - Messers Jobs and Woz visit Palo Alto Research Center and see
Xerox's Star/Alto/800 (depending on what story you read. I go with Star)
workstations.

1981 - Apple releases the first commercially marketed computer with a
GUI. The term marketed is used loosely, as the Lisa with Twiggy drives
(whoever on the Atari Historical page called them Ziggy drives listens
to too much Bowie, methinks) - a variable speed 5.25" that can store 1Mb
- is a sales failure, despite being supplied with a full suite of
programs as a complete package at $9,995, the Lisa fails.

January 24th, 1984. The Apple Mac is launched. Despite having an
appalling 128K RAM, people buy the thing and the GUI becomes an accepted
way of using a computer. Lisa is still being sold, but is soon tweaked
into compliance with the Mac market as the Mac XL - a 1Mb Mac (which
most only had 512K) with no sound capability beyond a beep.

1985-6. Everyone else does something similar. GEM, TOS, Workbench, Risc
OS, GEOS, various Unix shells (some of which I am sure had been around
longer), Windows for the PC. Even Apple release a 'clone' - GS/OS for
the 16bit Apple IIgs makes it better than an SE, as it was cheaper,
offered colour and better sound, and until they decided to clock it back
to 2Mhz, it was faster.

Incidentally, Apple's claim over Microsoft was partially successful -
it's why everything still runs in a Program Manager to this day,
mimicing that first Windows 2.0/3.0 layout where all your programs ran
within a window.

Richard (former Apple nut...)

Can't identify with the others (I wasn't around in the crystal radio
days :-) but this one definitely rings true. I had a 65XE, one 1050
drive, and an XM301 modem. The BBS was, unfortunately, a Commodore
one 'cos the only other person I knew who was 'connected' was a C=
buddy of mine. That led to LD boards in the states which eventually
led to a lone BBS that had Atari files on it. That in itself led to
local boards for me, and that's where it all started to get fun.

>When one of the people in my user group turned me on to the internet. The
>magic was the first night I figured out ftp get and put.

Did that on my Atari ST. Pine for news, Elm for my mail, Lynx for my
web surfing and running my own Speccy-based web page (I was really
into Speccy emulation on the ST 'cos the only ST-based 8-bit emulator
-- XFormer -- blew chunks and couldn't run anything useful) and TSCH
for my shell. Lotsa fun. :-)

On 02 Jun 2000 05:10:46 GMT, atarigirl1983@aol.com (AtariGirl1983)
drooled an embarassing wet spot in his lap as he typed:

>Does it really matter what type of processor, ram, etc? It is so confusing!
>Simplicity is power. As the itallians say, "What can I take away to make it
>better? What makes this the way it is? Emphasize that aspect." Today's
>computers have so much junk on them that they don't need, therefore
>comprimising the power and charecter of the PC, and of course, the simplicity.

Atari developers were typically concerned more with "Now how do I get
around THAT obstacle?" They always pushed the envelopes and made it
sing and dance in ways no one ever even considered. They had to --
Ataris weren't upgradable in the modern sense of the word, so it was
either work within the confines of the Atari's capabilities, or try
and find ways to expand those capabilities -- or rather, make those
capabilities work in ways never thought possible. I never thought it
was possible to play digital sound on the 8-bit without turning Antic
off -- then suddenly I'm confronted with the Veronica demo playing a 4
channel music MOD not only with Antic on, but with a scrolltext and
stuff going on on-screen! THAT'S progress! But then the Atari wasn't
filled with all sorts of superfluous stuff. It did what it did with a
minimal suite of programs because it didn't have the resources to run
with loads of bells and whistles.

Windows is a perfect example of why just because you can do something
doesn't necessarily mean you _should_. PCs are capable of lots of
things these days, but how much of it is necssary? How much did they
add that maybe we could have done without?

>Try deleting explorer completely from your system so that you can switch over
>to Netscape. Can't do it! And, for one, Microsoft creates too many updates.
>Sure, it looks nice and can do a little more than a potato, but why pay $200
>for a new version of windows? Just so that your computer can crash (esp. if
>your isp is AOL)? Is it really worth it?

Actually, I was speaking of Windows Explorer -- the integrated desktop
shell -- rather than Internet Explorer. Not that it matters, neither
are very stable, and both are things you're stuck with. (Although
there ARE Windows shell replacements out there such as LiteStep and
derivatives -- unfortunately they're VERY complicated to use and
maintain)

>It is frustrating to keep replacing parts on your PC. I had a really cheap
>modem in my PC. I have had my Cybermax PC for less than a year and have had to
>replace the modem twice. The last time it broke, back in October, I finally

>replaced it with a US Robotics 56K modem and it has worked ever since.

USR is a good company, as is Supra. I'd trust those brands.

>Last month, Windows decided to crash for three days. I went through 5 boot up
>disks until a friend gave me one she KNEW would work. Sure enough, it did, but
>this is really crazy to go though this much of a mess to fix a computer. They
>don't make them like they used to--yep!

I've had Windows completely fail on me a few times, requiring a
reformat and reinstall of the entire OS. The fact is, the more you
have that could potentially screw up, the greater the chances of it
actually happening.

>Atari needs to return to its rich computing heritage (sounds kinda hokey, don't
>it?). Why don't they make a PC? I am sure if they get the right programmers,
>they can succeed. They should make it durable like an 8bit, "powerful" like a
>modern PC, connect it to the net, but yet come up with creative design and
>layout. If they do (which I doubt) I will be on of the first in line to get
>it. I'm not asking for it to be a clone of a modern PC, but get the power and
>strength and charecter in one machine. Nice dream, huh?

They tried making XT clones way back and failed pretty miserably.
About the only marginally successful semi-PC-compatible machine they
ever made was the Portfolio palmtop PC. I owned one and loved the
thing. Unfortunately, the only advertising Atari ever did for it was
completely incidental -- it was the computer used to eventually foil
the T2000's plans in Terminator II: Judgement Day.

Huh? Linux supports AGP just fine, ethernet too. RH 6.0 found my
TNT, ethernet, scsi, mouse just fine. RH 5.2 found it just fine too.
Maybe you had bad luck when you tried Linux before. With most of the
modern distros there isn't much need to recompile the kernel unless
you need to support something really funky.

Write complex software in 95/98 using most any of the C/C++ compilers,
MS or Borland, and you'll end up needing to reboot a couple times a
day. NT is a little better, but you'll probably still end up having
to forcibly terminate the development environment to escape suddenly
broken programs- but do it under Linux (or other *nix'es) and you'll
see things work like they're supposed to and you won't need reboots to
clear strange states (except maybe if you're doing kernel/driver
hacking...)

But the selection of browsers is a matter of taste. I like how
Netscape works- to each their own.

Honestly, once the basic learning curve is over, I find Linux vastly
easier to use & it sure is nice to not be forced into a GUI all the
time. But this is an issue of taste too, some like GUI's for
everything, some don't.

I'll tell you one thing though, Unix handles high process loads much
better than Windows- and if lots of stuff has to run in the
background, it offers many more options for managing things. The
Win32 scheduler is dreadful. As an experiement, write a program that
starts a process at realtime priority and includes a counter that
watches loops/second. When its running, start IE (or Netscape),
scroll some webpage and don't curse too loudly when you see what the

low priority browser process does to the realtime process priority scheduling...

> that...

My only beef with the NT service pack approach is you're always having to reapply them when you change settings and files are recopied (AGAIN!) from the cd, but at least the frequency isn't too high.

But, back to the topic, I found Windows extremely booring; you're always having to buy something (or find it) if you want to do something different- or sit down and write it. That, and the same bugs/weirdnesses all the time, or at least a commandline architecture stuck in the DOS 3.3 era and a GUI that looks OK but you can't really get away from unless you want DOS.

When I discovered Linux a couple years ago, I was excited again. Open, plentiful commands you can easily stick together to do stuff, a decent command line shell, all kinds of software, Emacs- it was like discarding the training wheels and finally realizing what riding a bike is all about.

Because some of us think that windows is a really terrible platform, we could do better. And, many of us hate Internet explorer because it came preinstalled on our PC's. Perhaps we need Netscape for some purpose other than web browsing? Like web page building or it is the browser compatible with whatever you are doing (eClassrooms are one of the many things I can think of). Many of us agree in regards to the piracy ruling on MS. Can we just not like it?

First thing to do is not use a crappy emulator like XFormer (unless you're doing disk based stuff)

Get Atari800Win or the DOS version. Much better, more compatible and great sound, all the things XFormer lacks

Atari were fairly obsessed about product placement. I think there's a
big Atari logo in the background of Bladerunner too, or something
similar to that movie.

Yes, get Atari800Win! It's happy under Windows 2000, and I tried Xformer
- all the games I wanted didn't work, they're actually as good as my old
130XE under Atari800Win :)

And it's freeware ;)

On several levels, they deserve it. I was still actively programming in the mid to late 80s so I had a subscription to Dr. Dobb's. The rumored motto at MS was "DOS isn't done until 1 2 3 won't run".

Dr. Dobb's exposed several practices at MS that were IMO reprehensible. They were pushing their apps like Excel and Word over the industry leaders at the time like Lotus. In order to beat Lotus MS used inside information passed from the OS group to the application writters to make illegal calls/undocumented calls to the OS. They also deliberately wrote the various incarnations of the OS for incompatibilty with other apps such that the best they could do was patch their products.

While they were breaking everyone elses apps, DOS continued to bloat because they had to leave in all the illegal calls to there apps made to the OS in each subsequent version of DOS. Businesses had the option of using Excel or losing productivity when 123 wouldn't work.

This practice continued right through Windows, Dr. Dobb's even had column in every issue ~"Undocumented Windows" where much of the column was just taking apart MS apps and looking at the illegal calls.

> Confusion and frustration? I'm sorry, but Windows is the easiest OS to

Actually it has only gotten easier since ~W95, and that was by incorporating similar hardware diagnostics that I saw on Linux first. Prior to copying the Linux install procedure, you still had all the disk swapping and hardware selection.

> And Nestcape? hah! Microsoft IE is FAR superiour on every level. Netscape
> rarley displays web pages properly... load a page in Netscape and then try

I can't really tell much difference between the two to be honest. But this was another case of MS extended the language such that everything else lost compatibility with its product, then gave their junk away to drive everyone else out of the market.

Newer distributions of Red Hat are supposed to be quite good.

But Windows is not that great in comparison to other GUIs once you get used to them. I have used GEM on both the IBM and ST, I have used DR DOS 6.0 shell/GUI, bit of OS/2, even spent a few hours clicking on a Mac. If you spend some time in those other OS, Windows with all its problems like memory leaks and lockups makes it seem inferior to smaller and simple GUIs.

3411. ValForth Documentation

Newsgroup: comp.sys.atari.8bit

Hi,
I am looking for documentation for ValForth's ValDOS, Display Formatter,
and
Text Compression & Text Formatting. I recently obtained the original
diskettes
from Bravo Sierra (Ben Smith runs a smooth running and great place to
get Atari
stuff), but without docs. If you have copies of the docs and are
willing to part
with them, send me an email. -Thanks, Bill

One of the main things I'd like to see in SpartaDOS is re-entrant I/O,
in other words, the ability to read and write several files
simultaneously, like the Atari ST, the Amiga, for example.

It took until Windows 3.1 to do that, and Mac OS was no better... 7.1
IIRC.

You make some interesting points, but missed one essential one.

PCs were dull historically. Except for the Junior, they were all supposed to be business machines. Even the CP/M machines that preceeded them were made with that philosophy in mind. OTOH, the Apples, CBMs, Trash 80s and CoCos were produced for the home and/or educational market and were supposed to have more pizazz.

It was only recently, when employers found out that most of their employees were using the computers to play games and relax a little on the job, thus improving their productivity in the long run, that there was any interest in selling machines with any multimedia capabilities to businesses. (Of course, those employees had already started buying such machines to use at home.) And, in the workplace, mulitimedia meant dazzling presentations and, eventually, catchy Web sites. (My guess, BTW, is that dazzling presentations and catchy Web sites have made most people blas&#65533; by now, anyway.)

Just an addition that I think is worth mentioning ...

They tell me BeOS goes in like a charm, but the lack of apps written for it, outside of multimedia, is really sad. Linux will improve; some of the latest distributions install more easily, and the 2.4 kernel is supposed to take care of such things as lack of support for AGP, USB, bidirectional parallel ports, SoundBlaster Live, etc.

But when will all of this happen? The guys who are responsible for bringing out new kernel versions are not under deadlines or promises of vast riches, so they want to do something quaint -- not release it until they get it right! Meanwhile, Linux sits there, not really ready for prime time.

> Updates are a good thing. Bug fixes n stuff. You may argue that there
> shouldn't be bugs, but..have you ever tried to program? There will always
be
> bugs... At least it works and is up to date with the latest hardware..

This is true, but it's an odd mix. Some older bugs seem to persist through updates even as the majority of newer ones get fixed. There's always the potential for a new update introducing a new bug. Didn't we have that in the Atari community with BASIC Revision B?

And then, there's the pressure on hardware manufacturers to comply with de facto standards set by Intel and MS. That's not necessarily a bad thing, no matter what the Justice Department says. But there's another approach, and I hope it gets more play.

Did you read about the new Web appliance that will be partnered by Gateway and AOL? It will use a specialized Linux as an OS and a microprocessor that's not made by Intel, or AMD, or any of the other big ones. But that microprocessor has two amazing properties that might just push it, or a

derivative, into computers one day. It's microcode can be changed, and it runs so cool that the Web appliance in which it will be used will not need a fan.

Yes, Microsoft/Intel has produced some amazingly double-edged swords, and I truly believe that, split-up or not, it might be topped by relative unknowns in the forseeable future.

C'mon, Opera!

I'll go you one better. I used AOL a few years back, and asked repeatedly for them to carry several newsgroups, alt.binaries.comp.atari8bit among them. They downright refused.

But that shouldn't surprise me. In the late 80's or whenever AOL started, I thought that it was just another online service like CIS or GEnie. So, I asked them a dumb question, "Could you provide a file area for Atari 8-bit?"

Their answer was that if they couldn't make a profit by writing acess software for a platform and selling mega numbers of accounts to users of that platform, they wouldn't give it a file area.

Shell accounts with typical ISPs? They're getting pretty rare. Maybe there's no profit in maintaining them, either. But perhaps we should do some research and list the ISPs and other services that provide them _AS A DIALUP_ in the next comp.sys.atari.8bit FAQ.

> > but it exists)
>
> How does this work?

Antic cycle steals for the various modes. When Antic is fetching data from
memory the 6502 is halted. The higher the resolution the more bandwidth
Antic uses, the greater the performance hit. By Resolution I dont mean
map size, If you use a Graphics 0 style screen it causes antic to fetch
character
data too.

You can test this for yourself by coding something like:

```
10 graphics 3+16
20 for i=1 to 60000
30 next i
```

And timing how long it takes...If it's too quick for you and your stopwatch
then increase the 60000

Then just change the graphics mode in line 10
```
10 graphics 8+16
```

re run the program, and be ready with a stop watch... While this is
very crude it will give you an idea.

> Is there documentation that descibes the cpu hits of various modes?

Recently somebody ran some much better tests on the newsgroup
and actually figured out the equivalent 6502 clock speed, if your lucky they
may see this and repost the details.

Cheers
Pete

On Fri, 02 Jun 2000 07:36:21 GMT, "Jeremy" <1iquid@home.com> drooled
an embarassing wet spot in his lap as he typed:

>Why all the Microsoft bashing? Because they do what they do well?
>Confusion and frustration? I'm sorry, but Windows is the easiest OS to
>install and use out of every OS, and yes, I have had my little problems with
>windows, but in comparison to other OSes, it runs GREAT.

In order to install Windows 98, I tried unsuccessfully to do it over
top of Win95 OSR2 THREE times. I then had to format my entire hard
drive and install it fresh - and because mine is a Win98 Upgrade CD, I
had to do the old "md C:\WinNT" trick to get the upgrade CD to work
like a New Install CD before it'd think I had a qualifying product
installed and would continue with the upgrade.

And then Win98 finallly worked -- inasmuch as it DOES work. I still
get crashes several times per day (Explorer dying, mostly, but
applications will often stop responding for no apparently good reason,
or the entire system will freeze) And it's nothing to do with having
insufficient resources. I'm running on 64 megs of RAM, 31 gigs of
hard drive space, a 16mb V3 video card and a meagre (but sufficient)
P166 overclocked to 188MHz. I actually had a more stable system
running under Win95. I'm hoping the added stability of WinME will
help when it's released...

>And Nestcape? hah! Microsoft IE is FAR superiour on every level. Netscape
>rarley displays web pages properly... load a page in Netscape and then try
>the same page in IE and you'll see how it's supposed to look.

I hadn't had any problems with Netscape, and I find it runs a lot more
stable than Explorer does. I've never had a problem with improper
display, either; I've used Explorer from time to time and seen no
differences in the way the pages were displayed. Heck, I've designed
pages using Frontpage that look quite the same in Explorer as
Netscape. I'm working on pages now for a book publisher, and the only
problem I encountered was using dynamic positioning of text; it's an
unsupported feature of Netscape. Not a big problem, though; tables
work fine for positioning.

>I think alternate OSes are neat, and I had linux on my old PC, but when I

Try Corel Linux... looks very sweet, has a killer GUI shell, and
support of all the modern conveniences.

>Updates are a good thing. Bug fixes n stuff. You may argue that there
>shouldn't be bugs, but..have you ever tried to program? There will always be
>bugs... At least it works and is up to date with the latest hardware..
>Windows does have the benifit of having vendors write drivers...I'll admit
>that...

It's not a question of whether or not there should be bugs; those are
to be expected. It's the sheer volume of bugs and the destructive
nature of some of them. One of the ones I found deals with
multifunction mice; I have an A4 Tech 4 button dual wheel mouse, and
the thumb button is assigned to hold CONTROL down. If you click it
while a context menu is open, the app the context menu appears in will
stop responding. (Including Windows Explorer) This is the same bug
you can invoke if you double-click on an icon to open it while a
context menu is open.

It about how much testing is done on a piece of software before it's
released. Look at some game manufacturers. A lot of the time you go
and buy a game that *cannot* be completed without some patch or bug
fix. There has to be more quality control and standards of testing in
place these days. Games and apps are far more complex than they used
to be, but the testing process doesn't seem to have advanced enough to
keep in line with that. That's the real problem. Read the recent
debacle on Win2K ... 65,000 "issues" listed.

>Or, were you under the impression that the judges and prosecutors who
>broke up AT&T and Standard Oil didn't use telephones or petroleum
>products?

I'm not sure about Standard Oil, but AT&T had the US (and some
worldwide) communications networks by the balls. The consumer can't go
out and install their own phoneline (I suppose they can't refine their
own oil, either, but I don't know why Standard Oil was broken up -
wasn't that British Petroleum as well?). People can choose what software
they put on their computer, and market forces are not the same as taking
something absolutely vital and beyond the reach of the consumer and
controlling it totally.

You don't like MS, you buy something else. Sure, it's not compatible
with MS products, but then, AtariWriter wasn't compatible with
AppleWorks. *shrugs* I think Microsoft, for whatever reason, does
deserve to have been as successful.

Ultimately the break up of MS will make it a stronger company. People
generally don't want to change - I know my Dell would run a billion
times faster with Linux or BeOS (and I'm familiar with BeOS, I used to
run a BeBox) but what is here works, I can give people files without
problems, so why change? Ultimately this PC is a tool for doing certain
tasks, not a statement of my individuality or lifestyle.

Richard

I don't doubt what you said. I was once steered to a site that was supposed to list ISPs that offered shell accounts. That it did. But not one of them offered their service as a dial-up.

If a person has an Atari 8-bit and can't or won't use a PC as a proxy server under A.P.E. '98 or Tom Hunt's proxy program, he's still out of luck.

Kinda stupid you'd get docked for not using a particular font. That
has nothing to do with the presentation itself! Awell.. in any event
I never did much word processing for lack of any specific need to. I
did do a lot of gaming, programming and stuff like that tho...

As for the iMac... I dunno about character. It LOOKS funky, but it's
still a Mac. :-)

>Pac-man, arguably the most boring game ion the world, looks so much different
>on an 8bit than on a 2600. Graphics are so much more crisp and dynamic as
>compared to its predecesor. Gotta love that 8bit, man!

The 8-bit had much better graphic capabilities than the 2600, and
better sound capabilities, but that's to be expected. Then there's
the fact that Pac Man was universally panned on the 2600 anyway; they
COULD have made it much better than it was. Look at Ms. Pac Man and
you'll see a vast improvement, despite it being the same platform.

>anyway.)
>
>Just an addition that I think is worth mentioning ...

Granted that PCs were initially intended to be business machines. But
that's a part of the problem. Those machines that were intially
designed for the home user, and therefore were geared to be good at
everything but masters of nothing, had more pizzass and 'magic' and
tended to grab the attention of the home user. At the same time they
were much simpler to use -- less confusing. More focus was on
enjoying the machine rather than setting it up and getting productive
with it. Manuals weren't bible-length and didn't need to be. They
were simple, elegant, and powerful in the right hands. When the PC
started feeling its oats, it dragged with it its legacy of dull, dry
business apps, no sound support besides the omnipresent squawker, and
poor graphic support (CGA/EGA). Everything from that point on was
built upon that legacy, and while technology has advanced to the point
where we have fantastic sound cards, environmental video cards, and
blazing fast processors, you can still hear the dry rustle of
tractor-fed paper beneath it all. The PCs never had any significant
'magic' to them, and that hasn't changed.

Of course, I'm probably still a little jaded. I always sort of
resented Atari's death and pretty much being forced into the world of
Wintel, but I still think that the 8-bit machines were still the most

enjoyable machines to use. (Well, the ST was great fun, too -- but
that's probably 'cos I'd learned to program it well enough that I
could do quite a bit with it) I still havn't learned to program on
the PC and, quite frankly, none of the languages available are all
that inspiring. C++ is bloaded and clunky and I don't give much of a
damn about portability, and VB is I suppose fairly nice, but doesn't
let you program at any higher level. At least with GFA on the ST I
was able to bang the hardware directly to get the most out of it.

We do seem to be losing dialups in favor of cable modems type connections.

I will plug netmagic, I think I was customer #4 that signed up with them.
They have expanded to other cities, but I really doubt if they have a
presence in 1/2 the states.

They are also a bit prices, something like ~$26 for a full connection with
shell.

They have also deleted 90% of the good stuff you could do from a shell
account. When I first signed up with them, I had full access to the system C
compiler so I could actually edit/compile/run programs on their server. I
don't think they even offer 'tetris for terminals' anymore.

Only time the shell account gets used is for file transfers and some web
page updates.

I know what you mean. that is my main complaint about WIN 98. I have never had computer freezes under any other platforms, bun WIN 98, it is a daily frustration. And, I have sufficient resources as well, 32 GB memory, 64 megs of RAM, AMD Athlon processor (not sure of the stats on that, I just know I have it).

memory
> leaks and lockups makes it seem inferior to smaller and simple GUIs.

Windows certainly doesn't win many prizes in my book... you can add the
following list of OS's (With the user interface they used) to the list...

SunOS I only saw it crash when people did stuff like start a recursive fork
:-)

SGI Irix 5.x ... ran like any decent un*x, rock solid. Apps dont crash...
Surf the web, render stuff, compile, it just kept running... Indigo magic
desktop was great.

OS/2 2.0 & 3.0 Nasty configuration sometimes, but once installed fairly
stable. It didn't crash nearly as often as Windows 95/98 does.
Unfortunately IBM didn't market it well. When they came out they were
better than windows... Try comparing Presentation manager in OS/2 2.0 to
windows 3.x, Presentation manager is much nicer.

Win NT 3.51 Didn't really compare to OS/2 Warp. Bigger, slower and more
bloated... Oh it did have Open-GL which was nice! Gotta have that pipe
screen saver...

Citrix Winframe... (NT fixed up so it's more like a real OS)... Much better
than stock standard NT (3.51 in those days) but still surprisingly slow...
It would run for a few weeks before needing a reboot. Actually was usable.

SCO Unix... I hesitate to mention this, but at least it did seem to run for
a while without dying... even if it irked me at how much it cost/ how you
had to pay for stuff that any sane un*x vendor would give you for free.
(Like a C compiler!)

Linux. Excellent free OS, getting better and better day by day...
BSD's Other excellent un*x's.

As for 95:

When I first tried windows 95 I actually thought my hardware was messed up.
It just crashed and locked up far too often compared to other OS's.
Eventually I found out that this was 'Normal'. Since then, after having
serviced heaps of Windows 9x machines I now know that it's normal for it to
lock up at all sorts of incovenient times...

Cheers
Pete

3435. Advan Language Designs BASIC Compiler

Newsgroup: comp.sys.atari.8bit

Source record: 44308

Anyone here remember Advan Language Designs BASIC and Compiler? This is a disk-based BASIC that runs in a DOS 2 type environment that could not be copied. Does anyone here know if this BASIC was ever cracked to work on any other DOS?

This, to me, is one of the fastest BASIC on the Atari 8-bit. Too bad it was limited because of the copy protection. BTW, I bought a copy of this BASIC and have it on disk. Just wished someone made it work in a non-copy protected DOS.

3437. Bad MIO

Date: 2000-06-03 00:00:00 UTC
From: GaPressman <smarkmoore@mindspring.com>
Message-ID: <8hck5qvtq1@slb7.atl.mindspring.net>
Source record: 44310

I have an MIO that I had hooked up to two MFM drives. The MIO went bad as all I get is a scrambled screen when I hook it up to my Atari 800xl. Can I find another one or get this one fixed? Has anyone had this happened and was able to restore it themselves?

GaPressman

My two systems that are networked are attempting to run on W98. All I have to do to crash them is leave them on overnight.

Not sure if it is a problem with the screen saver or W98 itself, but two completely different hardware setups, MBs, sound cards, etectera and they both display the same problems. If they don't crash hard in a full lockup overnight, they refuse to run an ap because of insufficient memory.

BTW: You may want to take a look at QNX, I am a big fan eventhough I don't use it. For a demonstration on how tight and robust their OS is, they have a web browser/OS boot disk demo that runs on a 1.44 floppy!

I don't know if this ISP has national access, but one.net in the
Cincinnati, OH area offers a dialup shell account (w/100 meg of space) for
$19.95 a month.

It's been my experience that IE is much more tolerant of malformed
HTML. Netscape adheres to the HTML RFC better than IE. IE is designed to
work with the Microsoft web authoring tools (FrontPage). Have you seen the
crap that FrontPage produces? Sometimes it amazes me that any browser can
properly display that stuff.

I think Microsoft did this on purpose. Think about it: Newbie Joe writes
some HTML. Netscape won't display it because maybe he left off the closing

tag. But, IE displays the page because it determined where to end
the table. Joe thinks IE is better because it displayed his page when
Netscape didn't. Which browser is Joe going to use? That's great for
Microsoft, but bad for the web because now there's a group of people out
there that cannot do anything without a graphical tool since they know
nothing about HTML.

To me, such a list sounds very tough to build, and even harder to maintain. But if someone gets a list going and it turns out to be worthwhile, I'd be happy to include it in the FAQ.

Sounds like a good enough idea, but I agree with Michael, it would be hard to maintain and build. Perhaps someone might know of a few and would like to share?

You know what I meant. You have your preference and I have mine. If I had a choice, it would be linux all the way on my system. Yes, I know IE has web builder tools, I am just not allowed to use them for my purposes (School system burocracy, the whole school system is Netscape only and I am one of the nerds that builds pages for my high school's web site). And, I really find the design of IE to be really annoying.

Much. I think it was done by different developers - and obviously,
further on in the 2600's life when people were doing better games.
Best graphics I think I saw on the 2600 was Tunnel Runner -- plus, it
was addictive as hell, and lots of fun to play "fried" (er, not while
stoned, but when you flicker the power switch rapidly so that the game
still functions but the RAM gets all mucked up causing the in-game
graphics and in some cases maps get screwy. :-)

Kewl. I think that is what happened to my copy of Turmoil, but I don't really care, as I need the room in my bedroom, so something has to go and that would be my 2600. Look for it on eBay in a couple of days.

Actually, Mac's recent campaign was to prove that their machines could
play games. To that end they've tried suping up their graphic
capabilities and such to keep pace with modern PCs. It hasn't really
worked so far, but hey... they recognize their shortcomings, now! :-)

>Kewl. I think that is what happened to my copy of Turmoil, but I don't really

Pity, the 2600 was a classic. One day i'd love to get a collection
going. One day, mind you -- money's not THAT liquid yet to allow that
sort of thing. :-)

You could try atari.archive.umich.edu (if that subdomain still exists;
otherwise, try ftp.umich.edu) ... it's mostly ST stuff, but there's
an 8-bit section. Failing that, if you have an SIO-to-PC cable, I've
got tons in ATR and XFD images I could supply and you could teleport
to your 8-bit.

>Shame it wasn't an Atari design, really ;)

Yeah, but it bore the Atari logo, and that's what was important to me.
:-) And hey, that thing kicked butt. It was the modern day palmtop
without the colour or PalmOS/WinCE, years before those were ever
dreamed of. DOS-based, sure, but cool all the same. And with it they
found yet another use for the XM301 modem shell in the Portfolio's
Card Drive. :-)

>Atari were fairly obsessed about product placement. I think there's a
>big Atari logo in the background of Bladerunner too, or something
>similar to that movie.

Yep, there was a Fuji symbol on one of those giant display screens.
There was a recent discussion in rec.games.video.atari about that;
someone has a web page with all movies and TV shows in which Atari has
appeared in, or was rumoured to appear in.

I just picked up a complete 600XL at a flea market, and just discovered it doesn't really work.

It turns on, but the video doesn't want to work completely (I just get green fuzz as opposed to grey). I've double/triple checked the tv-atari connections, but to no avail.

Any thoughts/fixes?

Thanks,
John

Thanks for the link!

This would be a welcome change. I mean I really love the company and from reading their magazine, so does everyone else. Things like Motorola run QNX, offshore oil drilling platforms, I think even Hershy's Chocolate Bars are made using process controls running under QNX.

But way back when I was kind of interested in getting a copy for some projects I was interested in doing. Called with a simple question "How much is it for a single user licence?" got an extremely nice secretary who transferred me to a corporate VP for a 30 minute conversation about what I wanted to do, was there a potientially larger market, etcetera. I never got quoted a price.

I was hugely impressed by both their software and customer service, but they needed someone to say "$200 and you can buy a copy at Fry's" or whatever.

Standard advice is to leave it on overnight, sometimes that is enough to get it to boot.

Also check the power supply to make sure it is putting out a full 5V under load.

I can't remember all the things green screen can't be, but it probably means your ROM, GTIA, POKEY, ANTIC, are all working. Could be a memory chip has gone south.

Until now, QNX has mainly pursued the embedded/controller market. But other products are starting to pop up that are QNX powered. The iOpener, a $99 computer with a $25/month ISP, runs QNX. I believe Cisco also uses QNX in a number of their products.

<< I don't doubt what you said. I was once steered to a site that was supposed to list ISPs that offered shell accounts. That it did. But not one of them offered their service as a dial-up.
>>

Well, I took that to heart ... so I went back to the list I'd sent the link to, did the legwork for my local area and found several that did in fact offer dial-ups. I'll grant you, 90+% don't and national providers like EarthLink want you to reg a domain name with them to give you a dial up shell. So, they are out there to be found provided the end user is willing to put in a few hours phone time calling around. I have to agree with you though, that a better solution is just to use a cheap 386 or 486 PC as a front end as well as for the other additional advantages ....

Angela,

I still have one each of the following Portfolio items left in stock, in case you might want or need need them:

File Manager/Turorial ROM card (great user interface menu system for the Portfolio to avoid those cryptic DOS commands, as well as an excellent user tutorial to the built-in software applications) -- $5

Portfolio Owner's Manual and Quick Reference Card -- $5 for both

I also have a large library of Public Domain/Shareware software for the Portfolio (but the software is currently on my hard drive and I no longer have any way of copying onto Portfolio RAM cards). If you want this software and have a way to get it into your Portfolio, I can copy it onto either floppy diskettes or onto a CD. Figure $6 for the complete library on either CD or Floppy Diskettes.

Add shipping charges ($3.20 for Priority Mail within the continental United States).

Sheldon

I seem to recall it's just a bad sector check; re-writing the check to look
for sector 0 (which I seem to recall does not exist) should fix the problem.

3469. Bit Rot on Old Disks

Newsgroup: comp.sys.atari.8bit
Date: 2000-06-04 00:00:00 UTC
From: cryorunner@yahoo.com
Message-ID: <cryorunner-0406001608180001@dt083nd4.san.rr.com>
Source record: 44336

I've just been trying to get my Atari stuff up and running for the first time in a long time. And I'm running up against the same problem that happened the last time I tried to use my Ataris: All the floppies have terrible bit rot. I'm lucky if I can get one out of every two programs to run, and even then some of them may have errors that won't let them run properly (doesn't seem to be any errror-checking in these old things).

It's a real let down. Although I know that a lot of the games are now out on the web, there are some things I wrote that are irreplacable. And there are things like SAM that I'm not sure I'm going to find on the web.

I guess that there's nothing I can do about the disks I've already lost, but is there anything I can do in the future to slow this process? I want to use my systems with real disks (as opposed to SIO2PC type stuff), but would like to have some longevity.

Thanks for any tips.
-Rhett

One thing you can try is sector copying to new disks and hope the drive
and SIO will pick up the errors and report them to the copy program. If
you use a sector copier or DOS which allows you to adjust the retry count,
you can try setting it to 255 so that DOS will keep retrying the sector
read until (hopefully) it gets one good one.

TopDOS allows setting the retry count in the DUP.SYS menu and I've easily
patched MYDOS to do the same. Along a similar vein, I wrote a short file
to adjust (temporarily) the retry count in SpartaDOS.

3471. Re: Of Disk Drives (Again)

Newsgroup: comp.sys.atari.8bit
Date: 2000-06-04 00:00:00 UTC
From: Hall/Dobson <soba@istar.ca>
Message-ID: <waD_4.11222$lp.348009@cac1.rdr.news.psi.ca>
Source record: 44338

Thanks, all, for taking the time to respond.

1) James B.: Yes indeedy, the problem with the drive speeds was indeed PAL-related. When I tried a stock XE the drive speeds were right on. How arcane!

2) Hawk: <Since you tried so many drives, maybe try another computer?>

An elegant suggestion. I tried all the drives and--viola--one of them has rejoined the land of the living. Perhaps the cleaning worked after all. Thanks...

3) Scissorhands: Still no luck with the XF551. It was the first one I bought right after they came out, and I had trouble with it from the beginning. It would not transfer files larger than a certain size to/from another
drive. This seemed rather strange at the time, but I was new to computing and
figured it was me, not the drive. Later, the problem cleared up on its own. Perhaps the drive was made on a Monday...?

4) Richard: Many thanks for such detailed instructions.

<First boot it w/o the computer attached. If the track zero sensor is bad, the head will march across the disk on every boot, but never return to the outside.>

Tried this. The head moved inwards then returned to its resting position, which is good, right?

<With the computer attached, turn on the computer which will poll the drive and listen for I/O sounds. Track zero sensor will have the same stepping across the disk problems with cycling the power on the computer as it did cycling the drives power.>

If I understand you correctly...I booted the computer with the drive attached. The head performed as before, this time with a "Boot Error" message and a single I/O beep each time the message appeared.

<Watch the rotation of the disk under both set ups...>

Disk rotation okay.

...scratch...scratch...scratch...

The sound, not of my drives, but my fingers raking my scalp...

Any more suggestions gratefully received.

> Isn't there a way of writing ATR images to a real floppy using an SIO2PC
> cable?

If the image is a standard 90, 130, 180 or 360K one, you simply sector copy it from the make-believe SIO2PC/APE drive to a real one that will support the disk size in question.

> I know some of the demo compilations wouldn't work - they're huge
> ATR files

If they're larger than standard disk sizes, then they're almost certainly large disk images for which you will need to use a DOS which supports them i.e. SpartaDOS, BW-DOS, or MYDOS. In this case, odds are the ATR contains several files which could be copied individually to floppies. It's doubtful you'll find many demos greater in size than 130K (the unmodified 1050 limit.

> (and they don't work well under DOS 2.0/2.5,

Not much does when compared to the performance you get with more advanced DOS. Switching to Sparta or BW gives programs far more free RAM above Memlo to play with.

> but equally are not DOS 4 images,

If by "DOS 4" you mean Q-DOS from the Antic catalogue, you're better to forget it. It's essentially incompatible with everything else. The de facto standard format is Atari DOS 2.0 (720 sectors in either single or double density).

Have you tried to format a fresh disk in the drive yet? Sorry if you have
already said so, but I can't remember off hand.

But since almost everything is OK, formating a disk would tell you if it is
an alignment problem. The drive will read/write disks that are formatted in
it fine, but have trouble with disks formatted in another drive.

I had the same problem with files that were made into simulated ATRs rather then copied to a standard format.

All I had to do was boot D1: as a normal ATR with DOS files and D2: with the file/odd sized image, then copy it over.

My son has the exact opposite methodology. He checks what hardware Linux supports, then builds a Linux box using picks from that list.

It is expensive sometimes, nothing but name brands and popular hardware like 3Com and Creative Labs, but it is a valid approach.

That is a shame really. Most of my 8-bit collection work fine, but
there are some that don't. I would just d/l the many ATR files from web
and run an emulator.

I have had this happen to me, but not with an eight bit machine. I saw
this in a ST machine. What it turned out to be was loose computer
chips. The other possibility would be bad memory chips.

I did as you suggested, and managed to get one of the 1050s to format a disk and write DOS files. It was rather grumpy about it at first, but now seems cured of whatever was ailing it, and boots and reads any disk. Wow!

I also managed to get my malfunctioning XF551 going. The power supply port had broken away from the board. I did an ugly job of resoldering it and now it's working again. I remember reading somewhere that the I/O ports were pretty flimsy. I'll try to keep all cables permanently plugged in...

No luck with the other1050 though. It started the formating process then aborted at approximately the point where it starts writing to disk (my interpretation of what's going on). It aborts with a faint metallic click and starts chugging all over again. When I tried to read the disk in another drive, it read 0 sectors. Which means that it did something to the disk, but not everything.

Unless you've got any other suggestions, what I'll try to do now is remove its drive belt and install it in the drive with the broken belt. Any tips for that eventuality?

The sum of your and everyone else's help is that I now have 4 functioning drives where before I had only one. Thanks mucho.

Congrats!

I should get over it, but I lost two XF551s to board rot. I went though one round of fixing the board by resoldering, several upgrades so I could have both 5.25" and 720k 3.5" drives, then instead of old lousy solder joints breaking off like they did the first time, the PC board shattered with my new improved solder puddles like someone crumbling a saltine cracker into a bowl of soup.

If I had it all to do over again, I would probably use a hot melt glue gun to puddle 3" of adhesive onto the back of my XFs so the cables would never come out.<sigh>

=> it had trouble formating/bad sector at the abort stage on the disk. Could be anything from dirty head on the 1050 to a real bad sector on the disk. Ataris just bail out when they have a problem with a bad sector rather then try and recover the usable portion of the disk.

You may need to find a really good pristine disk. I know it shouldn't be so, but it really seems like 1050s are not all alike. I can remember swapping out drives to find the most reliable one for booting copy protected software, some just plain wouldn't load.

Hey guys,
I just attempted to make one of those adapters that allows you to use a PC joystick on your 5200.
I checked continuity, and everything seems right, but when I put in a game, like buck rogers, the ship moves all the way to the left and up, making it go at warp speed. by messing with the trim buttons I can get the ship to level out, but not slow down or move. Similar things happen with other games. Any ideas?

Thanks in advance,

John Barbour

First try shutting everything down and pulling all the connections.
Then hook it back up with just the MIO and test it. Often the MIO to
computer connection gets loose or the contacts get dirty. Apparently
it's an electronic "no no" but I've successfully used a soft pencil
eraser to clean the contacts. If you get it working, then try adding the
other stuff one at a time--with mine I often find the SIO plug causes
problems with the MIO and an even bigger culprit is the Real Time 8.
(A dead RT8 battery can cause major problems.)

Hi Guys,

I remember seeing that single disk stuff U mentioned Richard, but didn't get around to getting a copy... Thanks for the link David, I've stored it away.

David A. Paterson <david_p@storm.ca> wrote in message news:8he9p0$n10$1@news.storm.ca...
> Until now, QNX has mainly pursued the embedded/controller market. But other
> products are starting to pop up that are QNX powered. The iOpener, a $99

It was fun reading about the conversion of the iOpener to a generic box, able to run all manner of OS's (Including linux). I myself would have been interested if they had made it a little more open, so people who had the inclination to poke about with it and port apps to it could! Keep the turnkey mode for people who need it simple, but give the option of getting into the heart of the beast. I bet if they had done that, they would have been able to sell the non-brain damaged versions for more than 3 times the price. Even if they made only a few percent on the non brain damaged machines it would have given them more unit sales... It might also have saved them the grief that the 'mods' have caused...

> computer with a $25/month ISP, runs QNX. I believe Cisco also uses QNX in a

This auction has less than 24 hrs. left.
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=345382869

It is a 6 disk drive copy system made by L.E. Systems. A company Dave
Small was a part of. This Auction has a Atari 800 and the L.E. Systems
Disk drive system w/6 drives.

3499. Odd 800 Problem

Newsgroup: comp.sys.atari.8bit
Date: 2000-06-05 00:00:00 UTC
From: cryorunner@yahoo.com
Message-ID: <cryorunner-0506000031350001@dt083nd4.san.rr.com>
Source record: 44253

My Atari 800 has started doing this odd thing: It sometimes messes up characters on the screen. For instance it will miss-spell a word. Like it will replace "ITEM" with "ITAM" in DOS. But it seems to do these errors fairly consistently. Like it will mess up the same word (not all the time, though). What's really odd is that it will sometimes mess up the word after it has already been printed. For instance it will print the word right the first time, but the word will be messed up when it has to scroll the screen. I guess the character memory is just the same as everything else, but the programs do seem to run ok otherwise.

Has anyone seen this happen before? I haven't gone in there and just checked basic things like re-socketing chips. But I didn't know whether this was a common problem

3500. Using Odd-Sized ATR Files?

Newsgroup: comp.sys.atari.8bit
Date: 2000-06-05 00:00:00 UTC
From: cryorunner@yahoo.com
Message-ID: <cryorunner-0506000112140001@dt083nd4.san.rr.com>
Source record: 44254

I'm not very experienced with using virtual Atari disks in emulators or SIO2PC type programs. I'm just used to doing things like in the old days, with regular disks and normal DOS's. But recently I found a couple programs that I'd lost to bit-rot on a web-site as .ATR's, geared towards use with emulators. The problem is that these files are odd-sizes, with the minimum number of sectors to fit the actual game. I can't find a virtual disk editor that will let me move these games to a standard-sized disk image so I can open it with SIO2PC and get it to a real disk. I tried Atari VD Editor 1.23 (Mac), but it said it didn't recognize the disks DOS (and gives me a garbled directory).

I don't have any working with DOS's that can handle odd-sized disks, but I did try to use MyDOS 4.5 on my 800 with SIO2PC to load the files with no success.

Anyway, can anyone give me some tips on getting these files loaded on to my 800 and saved onto a normal 5 1/4" floppy?

Thanks in advance!
-Rhett

All to do with the VBI rate. NTSC has 60 per sec (Hz) PAL 50Hz.

> 3) Scissorhands: Still no luck with the XF551. It was the first one I
> bought right after they came out, and I had trouble with it from the

> another
Again, there is a PAL issue with XF551 drives. Unless there is a rom
Update in the XF, there will be problems with transfering to/from the
XF on a PAL computer.
The rev for the rom in the xf should be (from memory) 7.07.

Try a different emulator. Atari800Win and the old XF252 may be able to read
the .ATRs' in question. XFormer2000 will not.

>Has anyone seen this happen before? I haven't gone in there and just >checked basic things like re-socketing chips. But I didn't know whether >this was a common problem

It happens frequently when the moon is in the seventh house, and the stars are aligned with Mt. Fuji. Your computer has been possessed by the spirit of Nolan Bushnell, who is talking to you from a parallel universe where the Warner takeover was a merger, and the 1650XLD was a runaway success.

ITAM is an acronym for I Trusted Atari Machines...

To cure it, you must ritually destroy a Commodore 64 whilst in view of the 800, chanting, GTIA, Pokey, Antic repeatedly. With the final blow, you must yell "I shall avenge the marketing morons who destroyed our platform! I invoke the spirit of the Jaguar!"

Then, reseat all the boards, and power up. Hopefully the ritual will have worked. If not, repeat until there are no Commodore 64s left, or until the problem has gone away.

Richard

3504. 1050 ED copy utility

Newsgroup: comp.sys.atari.8bit
Date: 2000-06-05 00:00:00 UTC
From: Stephen Knox <gooch@erols.comX>
Message-ID: <393B9353.A9F55924@erols.comX>
Source record: 44258

Folks,

Been awhile since I've made backups of my Enhanced Density diskettes.
In the past I've found that DOS 2.5 ED and MyDOS ED are different and
you cant copy a disk between the two(Something gets left off when MyDOS
copies a DOS 2.5 ED disk). DOS 2.5 has such a slow copy utility that I
was wondering what programs were out there that supported DOS 2.5 ED and
could write without verify on?

Hello folks,
do you know some tv or cinema movies, that have a little reminder to
Atari ?!? I merely know these films:

- Starfight (sometimes Starflight, the movie to the game The Last
Starfighter; pretty funny, with over 300 computer scenes 1984 !!)
- Terminator II (Portfolio and old Atari consoles)
- Blade Runner (Atari Logo)
- Superman III (computer graphics by Atari ?!?)
- Outer Limits (Atari consoles in a bunker)
...

Thats all. Do you know more reminders to Atari in movies ??
greetings - Andreas Magenheimer

Law in the USA is you are allowed to have a back up copy of software that you rightfully own. Since the person breaking the copy protection has the right to make a backup and obviously has the original copy protected disk to do this with, and Nelson has an official copy, it shouldn't be a problem.

3510. Atari Vinyl singles

Hello,
many games from Poland were avaiable as copies at the ATARI AREA
Homepage. Unfortunately they are no more reachable (maybe they changed
the server or so). I already did some downloads from there, but only
downloaded the (unprotected) copies, where I also have the (protected)
original games... Maybe you find some other polish homepages that have
these games... Andreas Magenheimer

P.S.: Still searching the new URL for Atari Area and AIDS...

My 800 has done that a few times, nothing major. Fixes once left on for a few minutes. If that doesn't work then smack it a couple of times and it will, usualy.

3517. Atari XL cardridges secam/pal/ntsc ?!?

Newsgroup: comp.sys.atari.8bit
Date: 2000-06-05 00:00:00 UTC
From: ficsx22 <ficsx22@caramail.com>
Message-ID: <393BE5A8.5B8BCE17@caramail.com>
Source record: 44271

Hi there !

I have a question about the possibility to use american cardriges on
europeans Atari computers.
I own an Atari 800XL Secam (french system) since 1984.
I recently bought an Atari 800XL Pal.
I had a lot of cardriges and, without thinking twice, I used them on
both system, and didn't notice any problem.
A couple of days ago, I found a shop in the USA, selling Atari
cardridges at a low price. It sounds really interresting.

But a friend of mine told me that I would certainly be unable to use
these cardridges on my european computers.
In fact, the cardridge would run but the image wouldn't display.
But I do wonder if the cardridges are linked/bound to a video system.
Aren't these cardriges supposed to work internationnaly ?
If not, how come that I can use my french cardridges on my pal computer
?

Furthermore, I've just bought a french (but Pal) Atari 7800.
And I have the same problem: can I buy american cardriges for that
computer ?

I thank you a lot for having the patience to read me entirely.
I hope this trivial/simple/easy question won't bore you.
But I'm really longing to buy some new cardridges and an answer would be
appreciated.

Thanks in advance.
Laurent (ficsx22@caramail.com)

Hi! You can indeed buy the carts for the XL, but the 7800 won't run the NTSC carts.

Hi all,

I am just starting to develop a program in BASIC and I would like to know how to save it to disk or cassette. I have looked for it in various atari programming books, but I have yet to get a straight answer. Seems like an easy question but I cannot find the answer anywhere! Thanks my fellow atarians!

How about the one at theaters right now. It's called "Road Trip"
There's one kid who wears an Atari t-shirt through out almost the
whole movie.

From BASIC, type the following. You will need the quotation marks. You can leave out the drive number if you only have one drive or are saving to drive 1, but the capital D and the colon must be there:

SAVE "Dx:FILENAME.BAS"

Simple, no?

That's the thing with Linux at this point. You really have to check your hardware against the lists of what's compatible and what's not before installing it.

Then again, you might try one of the newsgroups. I'm sure that somebody has the same graphics card and was able to get it to work or found out that there's no way it will work.

I've been told that things are getting better with printer support, scanner support, etc., but graphics cards are still a problem because there are so many.

Sometimes, good things don't last.

We have a library system in Nassau County that started a free home Internet service. While it was set up for Windows and IE, you could also reach it with a simple terminal program. They ran PINE and LYNX on it, so you could get email and a limited number of newsgroups and browse the Web in text mode. An Atari 130XE running ICE-T in VT-100 terminal emulation did the job, even at speeds as slow as 1200 baud. Tech support, however, was limited to the graphical stuff. Nobody really knew how to handle the Unix shell operations. In speaking to those guys, I got the distinct impression that the only requirement for the job was belonging to the correct political party.

The system was soon overrun. Modems were 28.8K at their end, which were hardly up to the task. A second phone line was installed. But the stuff developed serious problems and needed to be replaced, just about the time that Nassau County ran into serious financial problems. A decision was made to shut the system down to home users.

I loved being able to access the system with my 8-bit while I had it. I even logged on with my PC using nothing but Procomm Plus, when I wasn't busied out. People with C=64s, Apple][s, older MS-DOS-basec PCs could all take advantage of it -- but no more.

However, there was money allocated to many library systems about three years ago, and many of them put in systems like this. Adjoining Suffolk county is still going strong, both on the Web-based side and on the text-based side. However, they are using a commercial ISP rather than trying to wing it themselves, and will spend what is necessary on equipment repairs and upgrades.

It might pay for anyone interested in using their Ataris straight to investigate what the public libraries are doing in their localities.

In FRIGHT NIGHT, there's an Atari 400 visible on that guy's desk (I forgot the name of the character). If there are indirect uses, TRON comes to mind (some sound effects were designed on the Atari). In STAR TREK III, when the communicators are activated, you can distinctly hear that familiar keyboard clatter from the internal speaker from the 400/800.

An Atari 800 was once prominently featured in an episode of "Sesame Street," in which Maria and some muppet were doing something educational. Only problem was, the "Atari 800" name and the Atari logo was covered up by some plastic covering!

An alternative, which may be wiser to do (although it takes longer) would
be using the LIST command in place of SAVE. This saves your file as an
Atari text file, which will make it easier to retrieve or fix in the event
you lose the program. I remember in those good old days of having to
actually type in programs yourself losing lots of files after spending
several hours a day typing them in! (That was particularly true when I
had the 410 recorder; quite unpredictable that thing was !)

To load, you would use the ENTER command in place
of LOAD or RUN. LIST AND ENTER can be simplified to tying L. or E.,
followed by the program name...

>-Rhett

You can simply increase the size of these ATR files by catenating a
text file to the end of it. Create a dummy text file of the
apropriate number of bytes with a text editor and then enter this
command from a dos prompt:
copy /b game.atr + dummy.txt new.atr
and this will create an atr file that has the extra bytes appended to
it. I do not know if XDIR would support these atr files. If so, you
could extract the files and put them in a regular ATR file.

Keep those XL's/XE's humming.

Any good sector-copier such as MyCopyR! will back up complete disks and
will allow you to defeat write with verify.

MYDOS will sector-copy a 2.5 disk if you use the optional syntax at the
prompt after hitting C i.e. "1,2(1-1040)". It will also allow you to
disable write verification.

As you've mentioned speed: switch your files to MYDOS format disks
wherever possible and use it as your primary DOS. One of the major reasons
DOS 2.5 is so slow is that the second VTOC is up in the hidden sectors (1023+)
-- you can hear the disk drive grind away as the read/write head gets
pushed over just about every track to write even the shortest of files.

MYDOS can read DOS 2.5 ED disks but cannot safely write to any sector past
720 on a 2.5 disk. If you have two disk drives, conversion is easy--just
boot MYDOS and use a wildcard file copy. If the disk is bootable, make
sure you write MYDOS to the destination before copying the files and
ensure you exclude the DOS 2.5 files in the file copy. Obviously, this
can also be done easily with a RAMdisk and single drive.

I'm not using an emulator; I'm trying to get these files to run on a real
computer. Are there emulators that will also serve as librarians such
that I can convert these files to a "standard" format/sector-size so that
I can then send it to my 800 via SIO2PC?

If SIO2PC is able to handle the images (I thought it could handle in
arbitrary
size image), all you would need to do is copy sectors 1 to x from the SIO2PC
drive to the real disk. See other articles posted here is the last week
on how to do it with Mydos. x can be calculated by taking the file size of
the atr, subtract 16 and then divide by 128.

If any of the files display a 'k' in the upper left corner of the screen
when
booting, you can retrieve the original executable using programs available
at my site.

>One thing you can try is sector copying to new disks and hope the drive >and SIO will pick up the errors and report them to the copy program. If >you use a sector copier or DOS which allows you to adjust the retry count, >you can try setting it to 255 so that DOS will keep retrying the sector >read until (hopefully) it gets one good one.

Isn't there a way of writing ATR images to a real floppy using an SIO2PC cable? I know some of the demo compilations wouldn't work - they're huge ATR files (and they don't work well under DOS 2.0/2.5, but equally are not DOS 4 images, meaning seeing the demos is a real chore).

I know it is probably a good idea to jut use a cheap old 486 to connect to the net with, but perhaps it is a matter of showing off the power of your 8 bit when you connect to the net with it. I did some looking as well but no such luck as some ISP's have PC only policies for shell accounts. Kind of dumb to me. Besides, it would feel much more comfortable and fun if I could connect to the 'net with one of my 8bits (I think out my collection my 1200 XL or my 800 would be the best bet).

>Well, I took that to heart ... so I went back to the list I'd sent the link

From what I understood, SIO2PC refused to load the image.
Simply adding garbage bytes to the end makes the file the proper size,
so that SIO2PC will accept the disk image. Then you can use a sector
copier to copy the disk to a Real disk and use that on the Atari.
Granted, if you want to use a DOS to copy the files, you would need a
proper VTOC. But there are sector copiers that simply copy the entire
disk, such that it does not matter what data is on those sectors.

Also, if the directory sectors are in place, but not the sectors
beyond those, space is saved and the sectors that have no data on
them are never accessed anyway, so it does not matter if they are not
really there. I do not know if this is the case, since I did not
examine those disks. I only understood from the problem description
that SIO2PC would not load the image file.

Keep those XL's/XE's humming.

This is terribly slow, though, even from disk, since it has to read
and parse every line instead of just reading and interpreting the
tokens of a saved BAS file. It's wise for backup purposes, but for
every day saving and loading, it's better to SAVE it.

I was thinking the same thing...

and you omitted SAVE"C:" and LOAD"C:" which we found to often be more reliable than CSAVE & CLOAD on our old 410. There was a difference in the inter-record gaps and maybe the tokenized file structure? IIRC it used more tape and time....

Sometimes the LIST"C:" had the advantage of preserving parts of your code when tape errors occurred. When BASIC detected a LOAD error it would abort and clear the program buffer just like a "NEW", BUT if it encountered an ENTER error it just shut down leaving anything already retrieved intact.

-Ron

I don't have a solution but I admire the problem.

Jeez, that brings back memories. When I got my first 600xl, I didn't
have any means of storage or retrieval -- just the 600xl itself. So
when I started poking around in Basic (which was the first thing I
ever did with the machine 'cos I didn't have any cartriges or games
for it either, just the programs in the back of the user manual) I'd
write down any programs that were kinda cool in this book, then retype
them every time I wanted to play with it or show someone. :-)

Of course, my getting a 410 casette recorder helped immensely... :-)

Casette was the first and only media I was able to do anything with.
I didn't like it 'cos it was horrendously slow -- but I had no other
choice at the time. Plus, the intermittent beeping could set one's
teeth on edge after 15 minutes of load time. :-)

I know. I generally go through the HTML that FrontPage produces and
weed out all the BS.

>I think Microsoft did this on purpose. Think about it: Newbie Joe writes
>some HTML. Netscape won't display it because maybe he left off the closing
>
tag. But, IE displays the page because it determined where to end
>the table. Joe thinks IE is better because it displayed his page when
>Netscape didn't. Which browser is Joe going to use? That's great for
>Microsoft, but bad for the web because now there's a group of people out
>there that cannot do anything without a graphical tool since they know
>nothing about HTML.

Indeed. I used to write HTML code in Pico under Linux... 'course,
HTML has gotten so complex these days that it's faster to use a
graphical HTML editor and weed out the crap than to write the HTML
code by hand. Still, for Joe Stumblebuddy who wants to make his
Geocities page about his fascination with pocket lint, he'd use
Frontpage, post the code verbatim and use Explorer 'cos -- hey, it's
all handy and it's there. Most newbies use what comes with the system
anyway -- that's why Outlook Express is so popular and why so many
people got bitten by the Love Bug. (i.e. the "I Love You" virus) Me,
I try and use as little of Microsoft's products as I can. I use
Office -- for Word, even if it IS a bloated whale that keeps getting
SLOWER with each release -- but I use Agent for news browsing, Pegasus
for E-Mail, Bulletproof for FTP, and so on. I use IE on occasion when
I just want to look something up quickly and can't be bothered waiting
for Netscape to load -- but I do NOT use IE for any extensive
browsing.

I seem to remember something about this... loading a BAS file, then LISTing it to disk, re-ENTERing it, then re-SAVEing it to disk cleaned out any garbage that might start to collect in the BAS file as it's saved over and over again.

I was amazed when I first got into Atari that you could save a program on cassette, but I can see everyone's disgust with them. But, it is a lot easier to buy cassettes than it is to buy 5 1/4" floppy disks anymore. But, still, cassettes seem to be a clumsy way to store programs.

Body handling: HTML body converted to readable text

I know very little about HTML though I use netscape. I learned HTML (hyper
text messy language), then they (teachers) got me started on using netscape
composer. Hey, I forgot my HTML! UGH! Sometimes people underestimate the
power of actually knowing how to do something without a design tool.

Adding extra bytes will not recreate the missing sectors which would have the
VTOC and DIRECTORY information which appears to be the actual problem here.
You will still need to use MyDOS 4.5 with the Duplicate specified sectors
option:
"J" and then "2,1/N(1-??)"
replace ? mark with final sector number to copy.

> I do not know if XDIR would support these atr files. If so, you
>could extract the files and put them in a regular ATR file.

NOT without a good directory; even XDIR needs the directory info to access the
data....

-Ron

I don't have a solution but I admire the problem.

Based on what the directory looks like when mounting the disk with SIO2PC
using DOS 2.5 or looking at it with Atari Virtual Disk Editor, I would say
that the directory problem described above is occuring. It looks like
whatever data was expected in the directory tracks is not there.

I'm not sure I entirely understand the MyDOS hack described above and by
at least one other kind poster, but I'll try to figure it out. I still
wish there were a way to just edit the ATR before it left the (modern,
fast PC) computer, so that I could just drag-n-drop a disk together before
writing it physically to 5 1/4".

Anyway, thanks again to everyone for their tips.

Man, that album is great! I know a lot of people probably didn't listen
to it beyond the "hit" song, but there was some OK stuff there. "Ode to a
Centepede" is a really dark song.

I had tried to revive my poor old Columbia cassette a few years back, and
the music still held up great. When I bought my real Pac Man years ago to
start my "arcade," I started looking for a CD. Buckner and Garcia (the
band that released "Pac Man Fever") eventually did release a CD of the
music, but it was a re-recording, so I didn't buy it. You can still find
the new CD at
http://bucknergarcia.com/
You can also find the LP and cassette on E-Bay at very inflated prices (I
DON'T recommend you buy the cassette!)

A few years back when I was starting to think I was so cool for buying my first two arcade games, I was driving near a local university when I saw a kid (ie college freshman, born in ~1980) wearing an Atari shirt. I'll have to admit I was a little puzzled. And I realized I am definately NOT hep. But that icon has survived (in a somewhat warped form) to the youunger generations. Boy am I old.

My program ACVT can be used to convert between different Atari disk
formats.

With command line switch -classic it will convert the file to some of
the classic sizes.

If you are talking about those 'exe' files converted to ATR files (KBoot
- it displays small k). They need to be repaired. You can do that
manually or by specifying option -autorepair. With such files you may
also use my program ADIR, which is able to extract exefiles from the ATR
images.

Both programs could be found on my homepage - they are compiled for DOS.
Sources should be compilable with any GCC port.

Usage would be:
acvt bad_file.atr good_file.atr -classic

And it has the significant side-effect of using essentially high
quality hardware- often much better than the stuff you get with the
"standard" Dell/Gateway style packages.

Message-ID: <393D391E.99EAB4F8@t-online.de>
Source record: 44236

Hi!

I bought an Atari 400 UK-version. After plugging it to my german TV (which has PAL G) I had a excellent picture on screen - but no sound (yes, I loaded a program that uses sound). Does somebody know how to get the UK 400 working on my german TV properly? What parts need to be changed?

Looking forward to your answers,

Andre

```
Oh, yes.
Another tip.
put a :
0 REM
at the beginning of your program before LISTing it.
Doing so will often save problems ENTERing LISTed files.
Russg
```

From: Russg <russg@en.com>
Message-ID: <393d460c$0$1401@news.erinet.com>
Source record: 44239

And yet another tip.
After you LIST, NEW, ENTER, SAVE to a new filename.
LOAD the just SAVEd file and LIST it to screen, all the way to the
end. Sometimes the newly SAVEd file will have garbage at the
end and you'll have to ENTER, LIST to screen, and SAVE again.
Russg

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

OTHER USENET NEWSGROUPS:

Welcome to the comp.sys.atari.8bit newsgroup!

Atari 8-Bit Computers

Vendors and Developers List

"A comprehensive list of vendors, developers, publishers,
and repair shops for Atari 8-bit computers and their users"

Additions/suggestions/comments/corrections are needed! Please send to:

Michael Current
mailto:mcurrent@carleton.edu

Please refer to the latest version of this FAQ list whenever possible!

Available via these locations and Usenet FAQ archives everywhere:

http://www.faqs.org/faqs/atari-8-bit/vendev/

ftp://rtfm.mit.edu/pub/faqs/atari-8-bit/vendev

news:comp.sys.atari.8bit news:comp.answers news:news.answers

Or you can always ask me for a copy at mailto:mcurrent@carleton.edu

------------------------------

Subject: Introduction

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be
listed here. "Major" PD/freeware/shareware developers should also be listed.
Persons or entities holding rights to products, but not selling or supporting
them in any way, are NOT listed here.

"Vendor" = Reseller of products produced by others. Types of products
sold are given in categories: new hardware, used hardware, PD/freeware/
shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the
developer are listed. No product can be developed by more than one
developer. No prices are given.
```

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair many 8-bit Atari and related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope. When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Super-Brief Copyright Primer

Commerical software - protected by copyright, may not be copied except for personal archival purposes
Shareware -protected by copyright, may be freely copied and distributed, shareware payment required for continued use
Freeware - protected by copyright, may be freely copied and distributed, no payment required for continued use
Public Domain software - NOT protected by copyright, anyone may do anything with it, period.

Software is protected by copyright from the moment of creation. No copyright notice is required for copyright protection. Software does not enter the Public Domain unless explicitly released to the PD *by the copyright owner*.

My article "Intellectual Property Protection for Computer Software" appeared in Atari Classics, 3(1), 1994, pp. 4-7, or see:
http://www.library.carleton.edu/staff/michael/acarticle.html

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

"Hi!" to Marek Tomczyk, who has supplied so much information from Germany.
"Hi!" to Alex Martin, who has done the same for the land of Poland.

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

There was a film in the early-mid eighties about a female hacker who carred an 800 & 810 around in her rucksack. Loads of Atari scenes as she hacked in, loaded stuff etc all with authentic screens too. She discovered the US banks were being hacked and that a foreign power was aiming to bring down the US finance system and bankrupt the country. Can't remember the name of the film though - argh.

I remember "Whiz Kids." I believe the show essentially revolved around a bunch of kid hackers who fought crime or some such ilk by using computers to infiltrate systems. I think there was one episode where they used an Atari 800 to break into a building's security to set off fire alarms and sprinklers to nab the bad guys inside.

"Knight Rider" sort of featured an Atari. That was the episode of the computer geek who was able to hack into the car and control it from his computer (not an Atari). In one scene, KITT (who was stuck in a box that Michael Knight had to carry around), was able to scan the guy's computer for its contents and one of the graphics shown was the 8-bit version of Pac-Man. The guy was also using an Atari joystick to steer the car.

>writing it physically to 5 1/4".

IF it is a boot disk with no need for the directory info, and all you want is a
92176 byte file, the the concatenation previously mentioned should set you up
to do a quick sector copy to a 5 1/4".

-Ron

I don't have a solution but I admire the problem.

Wasn't there an Atari in WarGames?
Also, there was a TV series during the 80s which feautred a wiz-kid hacking into some secret project (or his school files, or both) and he had a 'puter-room with 800s in it. I think it was called "Whiz Kids", best bet it was from 1983. (That kid also played in 'Little House On the Prairie'... as Laura's adopted brother)

One assumes that this was just the car's computer, and not the whole
Firebird?

> was able to scan the guy's computer
>for its contents and one of the graphics shown was the 8-bit version of
>Pac-Man. The guy was also using an Atari joystick to steer the car.

So after five minutes, he'd have sore hands if it was a 2600 stick, no
control if it was a 5200, and probably have given up if it was the
cheapo variation of the 2600 stick shipped with XEs?

(Of course, if it was the paddle-like XL stick, he'd have been able to
drive coast to coast without RSI...)

Richard

Yep. For some reason, when I was writing that message, I was thinking of KITT as in the CPU, the personality, and not the physical car itself. My bad! I don't think we're going to be in the George Jetson era any time soon (i.e., carry a car compacted down to the size of a briefcase).

Hi all, I just found some really cool (and bizzare) atari mp3's! Thought I would share since there has been a lot of talk lately about atari vinyl singles.

Atari 800Xl Game Sounds
http://artists.mp3s.com/artists/123/free_loops_and_samples.html

Atari Manslaughter
http://artists.mp3s.com/artists/43/hydrochloride.html

Atari Song
http://artists.mp3s.com/artists/42/00_bugexe.html

return of atari
http://artists.mp3s.com/artists/11/efunk.html

Atari Love Song
http://artists.mp3s.com/artists/68/stasischamber.html

Anyway, this is just a few, I think you could find some more if you looked beyond mp3.com

Hmmm... here a story.

Several years ago, my nephews had this game on cartridge. I had the APX
version and loved it, and I'm also interested in WW2, so I photocopied
their manual. Some years alter, when they got tired of the A8, I got everything
that remained from their equipment, including the Eastern Front cart... but
they had lost the manual! Fortunately I still had (and HAVE) the photocopies.
I don't know... maybe I could scan them. Do you think Chris Crawford or
anyone else would care?

Sorry for the confusion. SIO2PC will let me mount the image. But when I try to get a directory off of the "drive" using a standard DOS like 2.5, the directory is garbage.

So the problem doesn't exist. Because for 'boot' disks there is nothing
like 'directory' so that you must use disk copier and not file copier.
Or use such tools as Howfen dos to create multiboot menu disks.

I tried converting everything to MyDos but some files won't work with MyDos as the DOS. To ensure easy use and complete compatibility I need to stick with DOS 2.5.

If the copy command you mentioned below works then that would save alot of headaches for me.

I wonder why the creators of MyDos created an incompatible Enhanced Density format???

A very bad bug Atari introduced with Rev B basic is it adds 16 bytes
to the end of each file for every save. Do enough load/save cycles
with the same program and you can run out of memory. List/enter will
get rid of the extra rubbish.

Atari came out with rev B.
Rev A was ment to be a pre release sent to atari for review. Atari
took it as finial release and made carts out of it.
Atari attemped to fix the contract code bug but made things worse.
I am not sure where rev c came from

Isn't ZIP an MS-DOS and Windows program. Need I say more? He probably didn't clean his harddrive often enough. And when you have SM oops MS stuff on disk, who know what sick things start to grow on that disk and inside your computer.

There was a switch on the back of my 400 which changed the sound
frequency. It's unmarked, but it did change it.

No... Wait. It was the C64C...

No. The 400.

Damn! I can't remember. Anyway, I'm fairly sure it was the 400.

Okay, I don't know if this has been mentioned (I'm not going through 40 posts to check :P)...

There was a TV movie with Gary Coleman (!) called `The Fantastic World of DC Collins' (1984), where he carried a backpack full of Atari 2600 carts that I -think- had spy plans on them...it was like a TV version of the movie Cloak & Dagger (another big Atari-themed movie, if it hasn't been mentioned either)...you can just look it up on www.imdb.com using "DC Collins" for the search :)

Ahhhh I would kill for a video of DC Collins :)

Latez,
JLsoft
EFnet #OldWarez

Oh, and the first movie you mention was called The Last Starfighter in the US...don't know if it was different elsewhere. I also see the logo on the side of the Last Starfighter machine as a stylized Atari Fuji logo (that flying sword thing)...

I accidentally wandered onto a web page that was doing side by side comparisons between servers. Only two manufacturers they had were HP and Acer.

HP was selling a 128 mb ~500 mHz PIIs for about $3,000 and Acer was asking about $1,800 for the same. Not sure about any bundled software, it wasn't listed. They weren't multi use machines, HP only had 1 meg of video memory and the Acer only had 4 megs.

I can't remember who to attribute this statement from, I think it was an Volkswagon mechanic, "If you want economy, you have to pay".

I guess you can't get a free lunch but one that isn't as expensive, only way to do it would be by staying away from the leading edge latest/greatest. I didn't really realize how much fault tolerant systems cost until I stumbled onto the web page. I think I can change my thinking to the way my son does it. If the choice becomes assemble from name brand$ vs give Acer $1,800 I think I can adjust.

Mindfield <diespamdie!!!mindfield@home.com> wrote:

: The 8-bit had much better graphic capabilities than the 2600, and
: better sound capabilities, but that's to be expected. Then there's
: the fact that Pac Man was universally panned on the 2600 anyway; they
: COULD have made it much better than it was. Look at Ms. Pac Man and
: you'll see a vast improvement, despite it being the same platform.

The 2600 Pac-Man was programmed by someone named Howie Warsaw (Warshaw?) if I'm not mistaken. He also did the ill-fated Raiders of the Lost Ark game. There was some really neat article in "Computer Games" magazine in 1984 that discussed some neat inside information on the Atari company. (The article was titled "30 Secrets of Atari.") It said that Warsaw earned like a million dollars in royalties for Pac-Man, yet another programmer who did a conversion of the mega-selling "Space Invaders" only took in a flat $11,000. Part of the article cited how several programmers became disillusioned with the company, their policies, their royalties, etc.; they all jumped ship or started their own companies (Activision, Imagic, etc.)

From: Richard Cortese <ricortes@netmagic.net>
Message-ID: <sjt4d92n2t569@corp.supernews.com>
Source record: 44095

Mostly directed at Larry. Been pretty much a disaster from an effort/time/fun standpoint. I can't believe I screwed up making a 1489 cable, and it took me 3 hours of staring at it to realized I used the wrong pin on the 9 pin connecter. Kept looking at the PC until I was numb before I checked voltages and Eureka.

Tried downloading APE for W95/98. My damn systems is so unstable I got about 5 lockups and a number of spontaneous reboots.

Also tried the APE 1.17 for DOS.

What *I think* I found were the two high speed boot disks in the distributions were not compatible. But when staying within systems, two real US Doubler drives would work at high speed along with the APE simulated drives. No errors other then freaking Windows locking up, drives just run at normal speed if you boot the wrong distribution. I should have checked for SDX, but couldn't find my cart.

This was with a 1489 using COM2 and DSR.

I did get some errors when just trying to run 2 real drives and an SIO2PC/RI on my old Tandy. I am sure this problem was due to SIO cables. I wasn't even running at high speed, just plugged in a SIO2PC cable, it worked so I then added 2 drives and nada! Backed off to 1 drive and SIO2PC cable and got sporadic reads and errors. Ended up cleaning the cables a bit and it cleared up. Finally added back both the real drives and didn't have a problem again.

3629. Re: 1050 ED copy utility

On Wed, 7 Jun 2000, Stephen Knox wrote:

> I tried converting everything to MyDos but some files won't work with MyDos
> as the DOS.

The most likely sources of incompatibility would be:

a. four-digit sector lengths in the directory listing (this holds whether
you're reading the directory from DUP.SYS or in BASIC, etc.);

b. RAMdisk numbering--stuff written for DOS 2.yuck assumes D8: only;

c. usage of "D:" instead of "D1:" in a program--with MYDOS D: is your
current working drive (and directory); and

d. the availability of multiple autorun files in MYDOS.

Fixing these is easy:

a. use MYDOS 4.53/3;

b. set up the RD as D8: and write DOS to the disk so that it will
boot that way in the future;

c. as long as you don't change it from DUP.SYS, D: will equal D1:; and

d. rename any AUTORUN.SYS file to filename.AR0.

> If the copy command you mentioned below works then that would save alot of
> headaches for me.

That was actually the response to the prompt in a duplicate disk command
to force the DOS to do a sector copy.

> I wonder why the creators of MyDos created an incompatible Enhanced Density
> format???
>

Actually, the DOS 2.5 format is the weird one. The format used by MYDOS
for ED is the same as it uses with all disks and hard drives that
require more than a single VTOC.

I agree. My wife had an equally compelling proof. Her organization
just went out and spent $150,000 on Dell servers @ about $40,000 each
(couple gigs of RAM, massive RAID 5 disk arrays, etc...)- pretty much
the standard
"buy-the-biggest-we-can-because-we-can't-figure-out-what-we-need"
approach.

I gave up on Dell completely when I asked one of their engineers what
the MTBF was on their "custom" SCSI controllers. He responded, "What
is MTBF?" Now if their in-house "engineers" don't know what an MTBF
is, can someone tell me why I should let one of their "support
engineers" into the same room with the hardware?

Some time later, I was in our local PC joint, they had a display unit
out, with a faster cpu, same ram, same raid stuff- but for ~$5000
each. It also had the significant advantage of using name brand
cards, disk, ram instead of the "official" Dell parts.

Why buy from Dell when you can get the same support buying from
Packard Bell?

>
>jkp

Actually it occurred to me that just catenating extra bytes to the end
of the file will not change the ATR header. So the header probably
still shows the smaller size of the image, and thus SIO2PC would still
not recognize it to be the size it would then be.
You could convert the ATR to XFD and then the XFD back to ATR to give
it a proper and valid ATR header with some of Bo's programs.
Anyway, there was mention that SIO2PC did accept the disk but that
reading the directory did not work. So I am not at all sure that I
really understood the problem.
Anyway, it would be nice to have a sector editor for the PC that would
allow easy editing of ATR files. I thought about writing such a
utility once, since using disk doctor II and stuff like that is really
a pain. Most of the time I use Synassemblers sector read and write
commands from the debugger. But then I prefer Synassembler, so I like
using it for all that sort of stuff too.

Keep those XL's/XE's humming.

On the subject of cassettes, back in 1983, I came across a very quick and easy way to verify that your programs were safely saved on tape. You simply type in one line program:

```
CL. #1:OPEN #1,4,0,"C:": FOR A=1 TO 400: GET #1,A: N. A
```

Then after the beeping (or buzzing sound), you hit RETURN and push the play button. Let the computer run through the loaded program. If the save was good, you get ERROR 136. It means it reached the end of the program, and everything is there. Any other error, and you should resave.

Man, I remember how EXTREMELY time consuming that process was. The agony was compounded because a few months after I got my 410 recorder, the mechanism that held the play button in place was broken, meaning I had to manually and firmly hold it down myself any time I recorded or loaded (and when you have big binary game files, that can amount to 10-15 minutes of torture). I eventually wound up with a quasi-hitchhiker's thumb on right hand. It's true! The uppermost joint of that thumb bears an annoying curve not present on my left hand.

Oh, the agonies we Atari owners have to go through! Fortunately, I got a 1050 for X-mas in 1984, but the damage was already done. :)

>Would it be the same place (somewhere in Illinois)?

It is a standard C=64/Atari monitor cable (now somewhat uncommon); they show up
on eBay and you can easily build yourself one with a DIN-5 and RCA pin plugs.
The pin assignments are here:
http://www.atari8bit.tmfweb.nl/pinouts.htm#monitor
This link seems intermittant; if so, go here:
http://www.atari8bit.tmfweb.nl/
click 8-bit homepage, then pinouts

You just connect the center of the RCA 1/4" pin plug to DIN pin 4-composite
video and connect the shield to pin 2-ground. Connect the DIN to Atari monitor
jack and RCA plug to VGA adapter.

-Ron

I don't have a solution but I admire the problem.

3639. Problems Saving In Basic

Hi again everyone,

I thank you all for your help BUT I am having major problems trying to save from Basic on my 1200XL. I am using Revision C and I keep getting Error-130 messages. Is there a certain sequence that one must follow in order to get a program saved on disk? Does it vary drive to drive? I have an 810 drive, 1050 drive, and 1010 program recorder. I tried to save to each of these storage devices about five times on different occasions. Thanks for the help already given.

>The 2600 Pac-Man was programmed by someone named Howie Warsaw (Warshaw?)
>if I'm not mistaken. He also did the ill-fated Raiders of the Lost Ark
>game.

Hey, I *liked* Raiders. :-) It was kinda abstract, and the graphics
were remeniscent of E.T., and it was a little buggy, but it was kinda
neat all the same. Then again, I liked E.T., too ... actually, I
liked a lot of games other people thought were crap. Except Pac
Man...:-)

> There was some really neat article in "Computer Games" magazine in
>1984 that discussed some neat inside information on the Atari company.
>(The article was titled "30 Secrets of Atari.") It said that Warsaw earned
>like a million dollars in royalties for Pac-Man, yet another programmer
>who did a conversion of the mega-selling "Space Invaders" only took in a
>flat $11,000. Part of the article cited how several programmers became
>disillusioned with the company, their policies, their royalties,
>etc.; they all jumped ship or started their own companies (Activision,
>Imagic, etc.)

I'm not all that surprised. Atari's management has been historically
erratic throughout its various owners. The Tramiels (or at least, the
sons of Tramiel) were the worst -- not for ruthlessness, but for sheer
incompetence. :-)

Generally, the longer the tape, the thinner the mylar, the faster the
bit rot sets in. I used to buy 10 and 15 minute casettes that were
made especially for recording computer data on. They even looked
cool, with blue aluminum reels. :-)

>I am not sure where rev c came from

I remember that. When I got my disk drive, I recall always using the REVBTOC.EXE program that patched Basic to Rev. C. whenever I did any Basic programming. Then I found Turbo Basic and was a permanent convert. :-) (A bit of history: Frank Ostrowski, author of Turbo Basic, also developed my favourite language on the Atari ST: GFA Basic! :-)

>
> Jessica
>

Error 130 is a non-existant device error which is not specific to BASIC or to any type of drive or recorder. Generally it indicates a syntax or spelling error in your command input. The most likely cause would be something like:

'save "d1:myfile.bas"' which will fail even with Turbo BASIC (which is case insensitive) and MYDOS (which can use lower case filenames). The reason for the failure is that there is no "d" device (also no "c" device). You must ensure the device name is specified in upper case (even in Turbo BASIC as it will not translate stuff within quotes).

Error 130 is 'unknown device'.
You're typing something wrong.
It should be like so:
SAVE "D:PROG.BAS
must be all caps. I can't figure what you're typing wrong.
You're not putting an "x" in there are you? Like SAVE "Dx:PROG.BAS.
The "x" is to be replaced with drive number 1, 2, 3, 4.
I dunno.
Uhm. The D: handler is loaded at boot time. You are booting
a DOS aren't you?
I dunno.
I think D: handler is booted with DOS Disk.
For certain, you won't be able to do a save without DOS installed.

Somewhere I have an issue of Creative Computing magazine from mid-1977
that has the game of Euchre in BASIC. I got this issue from NCC-1977
in the Creative Computing booth... If I can find this issue, I will
be glad to send you a .gif file scan of the program. I do *not* think
that OCR will work well with the listing...it looked to be done on a
teletype.

Hi Richard-
>What *I think* I found were the two high speed boot disks in the distributions were not compatible.<
Sorry, I don't follow you. Do you mean the ATR disks with APE that have APE_WARP and Sparta 3.2G?

> I wasn't even running at high speed, just plugged in a SIO2PC cable, it worked so I then added 2 drives and nada! Backed off to 1 drive and SIO2PC cable and got sporadic reads and errors. Ended up cleaning the cables a bit and it cleared up. <
I've had similar symptoms, although I've never tried cleaning the SIO cables. I'll try that. My usual setup is computer to Quintopus; then one switched SIO cable to 2 drives, and one switched SIO cable to the interface. I have the same results with or without the Quintopus. But the switched Q. let's me disconnect things without constant plugging/unplugging.

Richard, I thank you very much for your time and efforts in this quest of mine. The total number of people who replied was 6. Wish some more had, but I certainly appreciate the inputs of the six. I've got to go back now and review the findings, then I'll post them.

SIO2PC and APE are really slick when they are working properly, and for some folks make a pretty good substitute for an Atari hard drive.

Regards,
Larry

3653. Euchre in Basic

and >I keep getting Error-130 messages.

Sounds like DOS was not booted when you started the 1200XL..
1. you have to connect the cables
2. power up the drive
3. insert a disk containing DOS.SYS
4. power the 1200 with BASIC installed

This will install the D: device handler allowing you to utilize the File
Management System with the disk drive.

Error 130 means either:
1. DOS was not installed at boot or
2. You misspelled the SAVE"D:FILE" command badly enough that the OS didn't
recognize you wanted to access that D: device.

-Ron

I don't have a solution but I admire the problem.

>has it. I actually contacted the guy I sold my 8bit to, but he says he
>gave it away years ago.

Well I'll be. Looks like I have EUCHRE.BAS inside an ARC file. Dunno
if it's the same one, but I don't imagine there were many Euchre games
made for the 8-bit to begin wth, so this is probably a good match. I
can post it on alt.binaries.comp.atari8bit if you like, or you can
E-Mail me (remove "diespamdie!!!") if you prefer that way.

3663. TAF Flea Market June 21st

Newsgroup: comp.sys.atari.8bit
Date: 2000-06-08 00:00:00 UTC
From: "Daniel L. Dreibelbis" <dreibel@idirect.com>
Message-ID: <dreibel-BEB1D4.07431308062000@bigmomma.idirect.com>
Source record: 44180

agenda for the Toronto Atari Federation meeting of June 21st, 2000, 7:00 PM:

COME ONE, COME ALL to the first TAF FLEA MARKET of the new millenium!

TAF's famous flea markets have always been a great way for fellow Atari users to find the hardware and software they need to improve the Atari computing experience, or to sell what they don't need anymore. As well, it gives them a chance to associate with fellow Atarians. Sell your old stuff, find yourself a treasure!

this particular Flea Market will also give TAF a chance to sell some pieces of equipment that they don't need anymore to homes where they will get more use. And there's some interesting pieces we've amasssed over the years, so you may want to check this out.

As well, the Mario Becroft solutions (VGA adaptor, Mouse Adaptor, QWERTYX, IDE Board) will also be offered for sale. These items are a great way to use modern peripherals with your classic systems.

Admission - FREE
Tables - FREE

Please note - TAF does not support piracy. Anyone selling pirated or stolen goods will be prosecuted to the full extent of the law!

So come on out and have a great time at the TAF Flea Market! We'll see you there!

TORONTO ATARI FEDERATION User Group meetings are held on the third Wedsnday of the month in the North York Memorial Community Hall on the Lower (or Concourse) Level of the North York City Centre Library at 5110 Yonge Street at Parkhome Avenue. Parking garage inside the complex. Those using public transport can take the TTC's Yonge/University/Spadina line to North York Centre Station. Meetings start 7:00 PM, $2.00 to non-members. Membership is $25 CDN a year, and includes a subscrition to the TAF newsletter PHOENIX. A membership in TAF IS Atari support!

TAF Home Page: http://taf.atari.org
Ken Macdonald, TAF President + Mario Becroft agent: 416-533-0504 or anarkist@idirect.com
Dan Dreibelbis, TAF Vice-President and Sinclap Tamer: 416-766-4743 or dreibel@idirect.com

Okay at the start of the Princess Bride, Fred Savage is clearly playing Hardball, what I could never figure out is what system he is playing it on.

Also in the early eighties, our local public broadcaster TVO did a series on 8 bit computers called Bits & Bytes, it starred Billy Van. Although the show also included Apples and Commodores, the Atari 800 was set up as well. The whole show took place in one room with about six computer systems set up and was designed to familiarize the general public with home computing. Earlier this decade they did a Windows based sequal.

Or...I just found the "EUCHRE.BAS inside an ARC file" on the 'net.
You can download it at:

ftp://ftp.sunsite.org.uk/Mirrors/atari.archive.umich.edu/8bit/Games/Misc/euchre.arc

It is only about 11 k bytes, but you will need to un-arc it...

Not true.

SAVE "D1:TEST.BAS"
SAVE"D1:TEST.BAS"
S."D1:TEST.BAS"
S. "D1:TEST.BAS"

All work, when there is a DOS present.

SAVE " D1:TEST.BAS" won't work. Note the space between the " and the D.

No. You're wrong. It will work just fine and so will
SAVE "D1:PROGRAM.BAS

BASIC will ignore multiple spaces and the lack of a trailing quote.
```

I never do that anyway, kind of like proper english, since BASIC is designed to
be a lot like english, there are syntax rules similar to those in english.

>"John K. Picken" yg473@victoria.tc.ca replied:

>Actually, the DOS 2.5 format is the weird one. The format used by MYDOS
>for ED is the same as it uses with all disks and hard drives that
>require more than a single VTOC.

There is a little bit of both here; DOS 2.5 uses a different status byte in the directory (IIRC it is $43 & $63) for files which extend beyond sector 719 instead of its standard $42 & $62 for other files. DOS 2.0 and most others, including MyDOS, simply refuse to believe that those files exist and won't access them.

MyDOS dispenses with the file number tags in each sector whenever it uses ED (and hard drives that require more than a single VTOC. -jkp) in order to make room for the forward sector pointer to exceed 10 bits (1023); this causes DOS 2.0 & 2.5 to doubt that the sectors belong to the associated files and generate an error 164 File Number Mismatch.

This prevents you from copying individual files with one DOS to the other's disk, BUT MyDOS performs just fine to make back-up DUPLICATE DISKs of DOS 2.5 ED medis with the "J" & "1,2/N(1-1040)" command because even though the disk was formatted with the incompatible MyDOS scheme, it will be overwritten with the DOS 2.5 data and be a 2.5 disk. I believe the only caveat is preformat the disk with MyDOS to ED and then use the "/N" (=do not reformat) switch in the duplicate command parameters.

-Ron

I don't have a solution but I admire the problem.

The bit used in the status byte by DOS 2.5 is normally used to indicate
a file "open for write" which is why most other DOS don't see them. While
this was obviously intentionally done in some sort of attempt to maintain
compatibility with DOS 2.0, the unfortunate side effect is that you can
throw a DOS 2.5 disk in the drive and not find the file you're looking
file when using some other DOS. Years ago, our club newsletter editor
called me with just such a problem: he'd downloaded an article using
BobTerm and then logged off and booted PaperClip only to find no article.
The problem was the DOS 2.5 ED format.

> This prevents you from copying individual files with one DOS to the other's

Actually, I think both MYDOS and SpartaDOS are able to read all files on
a 2.5-formatted disk but will not write to the ED sectors. Sparta, in
fact, will not wrote to sector 720 on a MYDOS-formatted disk as it
assumes Atari format ends at sector 719. You shouldn't have to preformat
with the MYDOS duplicate disk format. IIRC the "/N" is mostly to save
time, if specified and the disk needs formatting anyway, the DOS should
go ahead and format.

FREE Monitor when purchasing an Atari 8 Bit Computer. Buy an Atari 800XL or an Atari 130XE and an Atari 8 Bit Disk Drive such as an Atari 1050 Drive & receive your choice of any Monitor in the Atari 8 Bit Hardware Catalog. And FREE when purchasing $50 of Atari Jaguar items, receive absolutely FREE, a +NEW in BAG Jaguar Composite Video/Stereo Audio Cable. Offer Available for Limited Time only. First Come, First Serve! Subject due to availability! Customer pays all Shipping! Substitutions considered.

I've added more and will be adding more Hardware, Software, Books and Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out into Atari Jaguar Hardware & Games. So checkout what's new on my Web Site. In Fact, check it regularly as my Catalogs are updated regularly. Customer's are served, first come, first serve! No competing in auctions. Just Sales, Support & Service! I have 8 different Catalogs, &

my SoftWare Catalogs are my largest. They have the biggest Byte Count.
You should see my inventory! I have TruckLoads of HardWare, Boxes and
Boxes of Software & Libraries of Books & Reference Material for the
Classic Atari 8 Bit, Atari ST & Atari Jaguar Game Machine! And
remember, if you can't come see me today, come see me tomorrow!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want and E-Mail me the rest! To expedite things, include your complete
Mailing address so I can figure your Shipping/Postage & Handling. I'll
be back after the weekend.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or
bensmith@teleport.com. If you can't reach me at benjamin.net see my

3685. Flight Sim II copy protection

Newsgroup: comp.sys.atari.8bit
Date: 2000-06-10 00:00:00 UTC
From: SII <jerry.glenwright@sixty3ink.ndo.co.uk>
Message-ID: <8hsvhcetr1@nnrp1.deja.com>
Source record: 44002

Anyone figured out how to crack FSII copy protection?

I have the original boxed version that I paid megabucks for back in 1986 (plus another boxed copy I bought at a garage sale) and I'd like to back it up for use with an emulator.

The main disk has a bad sector every eleventh sector but, as it loads in two parts I can't find the code that's checking these sectors (if, indeed, that is what's going on)

Help from knowledgeable programmers would be great!

Thanks

3687. TRON soudn effects?

Newsgroup: comp.sys.atari.8bit
Date: 2000-06-10 00:00:00 UTC
From: Will Dwinnell <predictor@compuserve.com>
Message-ID: <39422776.B4BFDA7@compuserve.com>
Source record: 44004

I remember an article from a long (!) time ago about making sound effects on home computers. There was some information on sound effects used in the movie TRON which were generated on an Atari 800 (there may have been some mention of the Apple][, also). Does anyone have this article or the source code (it was in BASIC)?

I imagine most of the sound effects in Tron were made with Wendy Carlos's
modular Moog system.

Not sure what sound effects would have been done on an Apple][, but the
machine that the programmer was using was an Apple ///

Thanks for the replies and sorry for the delay - I was away for a week.

I guess I really meant any cart, not just games. Dig-Dug is good one
for the list. Only have it in a silver box. Is it safe to assume
Eastern Front and ET and other brown carts also came in big boxes?

As far as MS Basic, isn't MS Basic a disk package, while MS
Basic II is a silver cart and smaller box ?

3698. Atari Floppy Drive Dilemma

Newsgroup: comp.sys.atari.8bit
Date: 2000-06-12 00:00:00 UTC
From: Michael Gale <mgale@bitflash.com>
Message-ID: <Rab15.3891$Rz5.151113@news.magma.ca>
Source record: 44015

Hi,

I recently acquired a second Atari 1050 disk drive for use with my 800 XL system. Both drives work well, and have given me no problems thus far. I wanted to daisy chain the two drives together, which shouldn't be too much of a problem considering that the system will allow up to four drives to be chained at once. The problem is that when the two drives are connected, only one drive will work at a time. There is a drive select switch that can be toggled, but that serves only to select the other drive (#1 or #2) - meaning that the system will use the one you have selected, and virtually ignore the other. I know that you can copy a disk between the two drives, but I am not sure what I am missing. I believe the cables are connected properly (there is not much room for error), and everything seems to be functioning correctly, well, everything except for that one little piece to the puzzle. Here is the state of my machine right now.

- There is a cable running from the computer to the first disk drive in port #1, and another cable running from port #2 on the first disk drive to port #1 on the second.

- Both drive select switches are set to the #1 position. Manipulating these switches seems to do nothing, other than selecting the other drive in the chain, of course.

- The OS I am using: DOS 2.6F

Any assistance you can provide would be appreciated.

Thanks,
Michael Gale

From: Alan Sharkis <asharkis@erols.com>
Message-ID: <8i3h8o$dg2$1@bob.news.rcn.net>
Source record: 44017

Michael,

Set your second drive so that it is drive 2.

When you copy from DOS, the syntax is:

Dx:FILENAME.EXT,Dy:FILENAME.EXT

where the first filename is your source file, and the second filename is
your destination file.

So, if you want to copy a file called FOOBAR.BAS from a disk in drive one to
a disk in drive 2, you'd hit C for copy from the DOS menu and then at the
next prompt type:

D1:FOOBAR.BAS,D2:FOOBAR.BAS <RETURN>

If you wanted to rename the destination file, you'd have that opportunity,
too. After typing the C and getting the next prompt, you'd type something
like this:

D1:FOOBAR.BAS,D2:NASTYONE.BAS

Note that the delimiter between the two filenames is a comma, unlike the
space that's used in SpartaDos or MS-DOS.

That should do the job.

Alan

The switches should be set to different positions, I can remember that
much!

Your problem is the drive select switches.
As you look into the back of the 1050:
both to left is 1
the one closest to you set to right is 2.
I forget the other two (3 & 4).
I guess closest to you left, farthest right is 3 and both to right is 4.
At any rate, you can't have them both the same.
I always made drive one the first in the daisy chain, but that's probably
not necessary.
If you're still having problems, you just say A from DOS menu
and say D2:*.* and D3:*.* and D4:*.* and see if the second
drive responds.

Netscape has a profile manager.
I don't remember exactly, but you can set up a profile for yourself.
Then you pick which profile you want when you log onto your ISP.
I just looked in my computer. Look under 'User profile manager'
in your netscape program group. This allows you to log on with
Mom's account, but for e-mail and news, have your own user name
and password. I think.

Source record: 44022

I assume that the 130XE has a ribbon cable from the keyboard
that plugs into the motherboard. At least, that's what goes on
inside my 800XL. It might be worth unplugging the ribbon cable
from the little connector on both ends and see if that does it.
If not, something may be fried.

I would just add that one drive must be set to "1" and the other drive must be set to "2." You might double-check those switches and flip them back and forth a couple times.

I recently added a second floppy drive. I was looking forward to playing of all things Alternate Reality with the benefit of the second drive, which if you think about it would eliminate all that horrible disk flipping when entering establishments. BUT Alternate Reality does not utilize a second drive!

Maybe one day before we all die of old age Phillip Price will go back and amend the AR source code to eliminate the nefarious copy protection and add multi floppy and hard drive support.

Or am I dreeeeaaaming? Al-ter-nate ReALity. Boop boop boop booo boop. Al-ter-nate ReALity.

Hi !

I�m looking for ATARI cartridges , especially games from Activision , Parker and other US companies.

I have some games for trade : Ballblazer , Rescue on Fractalus , Blue Max , Necromancer , Crossbow , Battlezone , Crime Buster , Star Raiders 2 , Lode Runner , Into the Eagle�s Nest , Airball,Gato,Desert Falcon , Archon,Eastern Front , Final Legacy , Football , Tennis , One on One (all games new and shrinkwrapped , cartridges)

I also have some XL tapes and software for other computers (ATARI ST,AMIGA , C64 , PC,Sinclair Spectrum/QL , Amstrad CPC) and ca. 80 ATARI 2600 PAL games (games like Fatal Run , Pick �n Pile , some Bitcorp games ...).

If you�re interested , please contact me ,

Thimo (Lord-Chaos@t-online.de)

>Russg" russg@en.com says:

>just say A from DOS menu and say D2:*.* and D3:*.* and D4:*.* and see if the >
second drive responds.

Both left is D1:; White left and black right is D2:

With DOS 2.6 which is a modification of 2.0, you will not be able to access D3:
and up without changing DRVBYT (1802 = $70A), writing DOS files, and rebooting.

The four bits in the low nybble of this location tell DOS which and how many
drives to manage. D1:=1; D2:=2; D3:=4 & D4:=8; just add the values for the
drives present; POKE 1802,TOTAL; write DOS; reboot. TOTAL=15 sets all four bits
for drives one through four and wastes some memory for sector buffers if you
have less than 4 drives
.
-Ron

I don't have a solution but I admire the problem.

> Anyone figured out how to crack FSII copy protection?

I recall that a very long time ago I worked hard on FS2, not really to
crack it but to understand the "language" used for scenery.... (which
was the same used on the PCs, BTW).

> The main disk has a bad sector every eleventh sector but, as it loads
> in two parts I can't find the code that's checking these sectors (if,
> indeed, that is what's going on)

A wild guess is that every track has a double sector and FS2 installs
its own SIO routines to handle that. I remember something like that,
but I'm probably mixing it up with something else.

> Help from knowledgeable programmers would be great!

If only I had my Atari (and the docs!) here.... :(((

Boot DOS and go to BASIC.

Type in: POKE 1802,3<Return>
CLOSE #1<Return>
OPEN #1,8,0,"D1:DOS.SYS"<Return>
END<Return>

This will set DOS 2.x up for drives 1 and 2 and write DOS to the disk so
it will boot that way in the future. Note the "END" can be replaced by
"DOS", "CLOSE #1", "LOAD ...", etc.--any command that will force BASIC
to close open channels.

If you want to get really esoteric, you can use "XIO 3" and
"XIO 12" in place of "OPEN" and "CLOSE" <grin>.

You could also just do the POKE and then go to DOS and write DOS files
but that just wastes time as there's no need to rewrite DUP.SYS. Any
Atari-compatible DOS (MYDOS, TopDOS, etc.) will write DOS.SYS to the
disk in D: (not necessarily D1: with MYDOS) as soon as you open DOS.SYS
for write and then close the channel.

You figure values in 1802 in binary as follows:

D1: 1 D5: 16
D2: 2 D6: 32
D3: 4 D7: 64
D4: 8 D8: 128

Add the values for the drives you want enabled and poke the total.

Do not poke in more than you need as that just wastes low memory
for unused drive buffers. The normal with DOS 2.0 is 3 (D1: and D2:);
with DOS 2.5 it's 131 (1+2+128) for D1: D2: and the D8: RAMdisk.

If you switch to a better DOS, you can set the drives from the DUP.SYS
menu (TopDOS) or not have to bother (MYDOS).

The manual was so full of errors as to be laughable. One program listing
even had "ERROR - " where the cart had spotted a syntax error but the
manual writer still printed out the listing and put it in the manual!

Go into Basic and type ? PEEK(1802). If it says 3, you're okay. If it
says 1, type POKE 1802,3 and then type DOS and press H (Write DOS Files).
If I remember correctly, Atari DOS 2.5 came with a setup program that could
be loaded from the DOS menu to set the number of drives.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

Hi there,
if you still get an Error 130 this often means the drive or the DOS is
not avaiable. Boot any DOS first (with Basic on), then try to save to
disk... maybe this helps. greetings - Andreas

Yeh, that would be good.. to matter the fact, I was thinking of doing this
myself, but if two or more were to pull this together....

So, when we say dialup, would a BBS with telnet access count?

Hi there,
you can always use NTSC carts on PAL systems. they will at least run,
but some of them will not have colours or flicker very much.
On the XL computer I have a few NTSC carts without colors on PAL system,
because they use that bad NTSC color trick, that does not work on PAL
systems (thinking of broderbund games...)

With the VCS 7800 and some NTSC carts you do not only lose colors, but
some of them flicker very much (thinking of summer & winter games and
others). AFAIK atari did not produce Secam computers or consoles
(maybe you use a Secam West tv but not a Secam Atari !!
Or do you own one of these ultra-rare french secam Ataris with SCART
instead of a monitor jacket ?!?). Newer european Tv`s can also display
NTSC without problems, maybe you should buy a new tv then...
But do not worry to buy the carts - they will always run !!
greetings - Andreas

hi there,
or create a new ATR image of a XL sector copy program, that will
continue reading even when errors appear (like Mycopier and many
others). then start that ATR (boot your Atari with it) and copy the
mini-ATRs back to the real disks. for all error sectors, the sector
copier will then write empty sectors, which is just what you need...

Well, the cool thing about the ST/TT/Falcon side of things is that yes,
there is the .DI format that is unique, and yes you do have to build them as
you go. But they are fairly well set once you do.
ATR, DCM, and XFD files work fairly well since you can download them to
the ST, and then get the Atari 400/800 computer to read and uncompress them
with various utilities. (Rather than have the ST do it).

Hmmm.. so it works on a TT? I'll have to remember that, though I am
fairly happy with the 1040ST I currently use.

3734. sio help needed

Newsgroup: comp.sys.atari.8bit
Date: 2000-06-14 00:00:00 UTC
From: "Foster L. Putman" <fangmans@bellsouth.net>
Message-ID: <394816B4.7253F1EF@bellsouth.net>
Source record: 44101

I have built a single chip (74LS00) sio2pc cable and can't seem to get
it working.
I have the cable daisy chained into my percom drive. With APE98 running,
I turn my 130XE on and get nothing from the disk drive. I do get a
scratchy noise as the ready prompt comes up on the monitor. When I type
DOS, I get the Atari test screen. On the APE monitor I get the
following read-outs:
Dev:31 Cmd:53 Aux1:00 Aux2:00 chksum:84 each time I reboot the atari.
I can get a different indication if I plug the cable in after booting up
on the percom.
In DOS, I get a different Dev # etc for each D: # I push on the Atari

I've double, tripple checked my pin-outs, connections, and solder joints
and can't find anything wrong. The correct voltages show up on the
correct pins of the IC. APE tells me that COM 1 is active, and the
monitor read outs would indicate that something is being read.

Can anyone help me out?

Lee Putman

IMHO: You should switch to a 1489 type since it is easier to build and
almost impossible to burn up anything. Been so long since I have seen a
74LS00 I have trouble remembering what it is about.

OK, this means the data out is working. Dev:31 => D1:, Cmd:53 => S or
Status. It also probably means you have the Command Line to RI wired right.

Scratchy sound could be two drives fighting for D1: or a bad ground. Other
then checking the ground, I seem to mix up pin 6 and 9 on a regular
basis<DOH!>, don't play with anything but the PC data out to Atari data in.
That will be the path from pin 3 of the PC to pin 3 of the Atari.

It was your article that I built this thing from...I had a handful of 74LS00s
along with sockets, resistors, and cables. All I had to buy was the zener and
card. Anyway, IBM3 in through a 1K res., with the 5.1v zener going to ground,
to pin 10 of the IC. Atari in out from pin 8 of the IC through a 1N914 diode.
All grounds are tight and right. I don't know what else to try.

My guess would be, as Rick mentioned, two drives fighting for the
same address. Try booting without the real drive. If that works,
make sure your APE and real drives are all set to different addresses.

I have experienced situations where SIO2PC and a 1050 absolutely
refused to coexist on the SIO bus; in that case I resorted to booting
off SIO2PC and (techs say this is bad but it worked for me) swapping
cables with the computer running when I needed a real floppy.

A recent thread on location 1802 with Atari DOS might also apply if
you get more than two drives.

Puzzler. Could be a problem with one of the diodes forward voltages. When I
was fooling around with the circuits I tried using LEDs for the
diodes<thought flashing LEDs would look good for an indication of activity>
and the circuit failed to operate with a 1.2V forward voltage: It really is
that close to not working at all with the 7400, .6V extra forward voltage
and it bites the dust.

I wouldn't give up on SIO2PC, but I would really go the 1489 route. The chip
is readily available from Radio Shack, buck fifty or so. Each gate of the
1489 is 3 tansistor inverting amplifier and only ~4k load. It actually takes
less parts/connections current limiting, outpus can take a dead short,
etcetera.

A poor ASCII version<heck, my web page was originally done a decade ago>
http://www.netmagic.net/~ricortes/1489.txt
A really good site with proper pics.
http://www.redshift.com/~cdyson/atari.html

If you have all the cables and connectors, 20 minutes or so tops to finish
it.

3744. Rana with a 6502

Newsgroup: comp.sys.atari.8bit
Date: 2000-06-15 00:00:00 UTC
From: llpwhite@cs.com
Message-ID: <20000615175649.17091.00000045@ng-ck1.news.cs.com>
Source record: 44111

I recently purchased a Rana 1000 that is a little unususal (I think). First, it has a rotating locking mechanism like a 1050, although it does not have a Tandon mechanism. But when I opened it up, I found a 6502 and 6522 instead of the usual 8031 mpu with an 8155 ram-timer. I've had 6 Rana's, and this is the first one I've had with a 6502. Has anyone else run into one of these? I'm presuming that this is a very early production unit, before a major cost-reduction effort that changed the direction of Rana's drives.

Comparing the boards, it's easy to see why Rana went to the 8031. I didn't count, but there are definitely fewer IC's on the 8031 board. Well, now the bad news. The 6502 board is bad. The drive powers up normally, seeks to track zero, then settles at track 39, but will only boot intermittently. It will boot, making quite a few read errors when cold, but after it has been on for a bit, it won't boot at all. Swapped out the mechanism for a known good mech, and the results were the same. Put the mechanism I had taken out into a known-good Rana, and after a quick adjustment on the radial alignment, it worked fine, even in DD. So the next question is what is likely to be wrong? Any guesses? I'd appreciate any thoughts, and especially if anyone has any more background info about Rana's.
Larry

3745. Re: sio help needed

Here are a couple of things to try, if you haven't already. I have never used a 74LS00 cable, but I've used both a 14C89 and MAX232 with APE98.

1. APE98 would not work at all for me using the RI line. Period. Try the DSR. Better yet, install a small switch, so you can choose depending on what interface software you are using. (SIO2PC uses RI.)

2. Do you have the speed in "Options" set to 1X? And do you have correct settings for your cable under the "Basic Serial Setup?"
Since you mention a Percom drive, your Atari should be running at 1X SIO speed.

3. If you build a 1489 cable, get a 14C89 and be sure to put in the .1uF decoupling capacitor as shown at Clarence Dyson's site. My 1489 cable without the capacitor would not work with a real drive in the chain. I put in a 14C89 and the capacitor and it works flawlessly, at least at 1X speed.

4. What you describe does sound like 2 drives fighting for the bus. What Dos are you using?
I have good success with MyDos 4.5.

5. Don't give up! Getting these things to work properly keeps life interesting.

6. There has been a lot written in this newsgroup about SIO2PC and APE. Go to deja.com and do a power search on these topics, and you will likely find a lot of good information. (although at the current time, everything before 1999 seems to be missing.)

Good luck.

I update my catalogs once a week. Just before this message is posted. So when you see a new posting, check my Catalogs. After I post this message. I'm off for the weekend. But I'll be back after the weekend.

If your reading for my Free catalogs, jump to the bottom, otherwise read on. I've added new items to my Catalogs, including, for the first time, ST Hard Drives, SyQuest 88 Meg removable Hard Drive, Software, Books, Light Pens, Atari Touch Tablet & some Cartridges for the ST like DVT VCR, ST Replay & Computer Eyes! So come and Get it! First come, first serve.

e-mail: atari@benjamin.net

To take advantage of Discounts or FREE Monitors or FREE Jaguar Video Cable, you must E-Mail me to Claim it & state what you want in E-Mail.

Discounts! Buy now! 5% Discount with a $50 Purchase. 10% Discount with a $100 Purchase. 15% Discount with a $150 Purchase. And a 20% Discount with a $200 Purchase. Discounts Apply to Classic Atari 8 Bit, Atari ST and/or Atari Jaguar. Hardware, Software, Books & Accessories! Shipping not figured into Discount. Customer pays Shipping. Limited Time offer! Substitutions considered.

FREE Monitor with Atari Purchase! Buy either an Atari 1040STF, Mega 2 ST or a 1040STe and receive a FREE Monitor. Your Choice of a Color or MonoChrome Monitor. FREE Monitor when purchasing an Atari 8 Bit Computer. Buy an Atari 800XL or an Atari 130XE and an Atari 8 Bit Disk Drive such as an Atari 1050 Drive & receive your choice of any Monitor in the Atari 8 Bit Hardware Catalog. And FREE when purchasing $50 of Atari Jaguar items, receive absolutely FREE, a +NEW in BAG Jaguar Composite Video/Stereo Audio Cable. Offer Available for Limited Time only. First Come, First Serve! Subject due to availability! Customer pays all Shipping! Substitutions considered.

I've added more and will be adding more Hardware, Software, Books and Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out into Atari Jaguar Hardware & Games. So checkout what's new on my Web Site. In Fact, check it regularly as my Catalogs are updated regularly. Customer's are served, first come, first serve! No competing in auctions. Just Sales, Support & Service! I have 8 different Catalogs, &

my SoftWare Catalogs are my largest. They have the biggest Byte Count.
You should see my inventory! I have TruckLoads of HardWare, Boxes and
Boxes of Software & Libraries of Books & Reference Material for the
Classic Atari 8 Bit, Atari ST & Atari Jaguar Game Machine! And
remember, if you can't come see me today, come see me tomorrow!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want and E-Mail me the rest! To expedite things, include your complete
Mailing address so I can figure your Shipping/Postage & Handling. I'll
be back after the weekend.

3754. Please, help for power supply 800xe

Newsgroup: comp.sys.atari.8bit
Date: 2000-06-16 00:00:00 UTC
From: BAchus <h.kamstra@chello.nl>
Message-ID: <394964BA.2E52453A@chello.nl>
Source record: 44121

I read the faq posting and yes!!, this must be the right groop.

I'll try to be short wich is diffucult for me.

Today I bougt a 2nd hand Atari 800XE at a dayly fair in holland. I am scince short a collector off old cpu systems and this one i didn't have yet. Actually i never ever had an Atari cpu, (I do have an Atari 2600 b.t.w.). But the problem is the cpu is wat i got and that's it, meaning no wires ore anyting. I bougt it together wiht 4 roms for 15 guilders = 7$. I thougt it to be a bargain, even if the cpu doesn't work becoase i got 4 roms!!

But looking at the 800xe i saw i just needed the usual tv cable like i use with my c64. But i also saw the 7 pins power supply port. And i thougt uh oh i don't have that. so my question is,
-does the 800xe need an adaptor
-how many volts does it adapt?
-what other power supply can i use, will the c64 adaptor work for instance?
-the c64 adaptor lacks a few pins whereas it does go in a 7 pins port as well, is this the same whith the 800xe?
-what do you all suggest i do besides looking for another 2nd hand adaptor?

Knowing how great the newsgroops can be i thank you all in advance.

Then one other question. I maintain a sit with called: Computer Emulation wich is about Up-to-Date emulators & direct linx to their games pages & OSroms if needed. Currently i am serving y'all wihth MSX, C64-Vic20-Pet, ZX spec/ZX81, Amstrad, Amiga, Atari ST, Apple II and the BBC-Microcpu.
So as you assumed, i have to add the Atari 800xe to the list, as someone mailing me already stated. (and other Atari cpu's??) so again i have a few questions
-what are the best 800xe emu's and where do i get them
-where can i find Atari 800 XE Games Pages with games for download to use with the emu's
-where can i get the OS-roms

I don't want to seem lazy becoase i will offcoarse also search for them myself but if you have any info, it would offc. be very welcome so i can add the Atari 800 XE to my page soon. vistit my page at:

http://members.fortunecity.com/computeremulation

Greetings to all

I'll give you 20 guilders for the CPU and you can keep the ROMs :)

>But looking at the 800xe i saw i just needed the usual tv cable like i
>use with my c64. But i also saw the 7 pins power supply port. And i
>thougt uh oh i don't have that. so my question is,
>-does the 800xe need an adaptor

Yes. It does.

>-how many volts does it adapt?

Depends on your country. Since all 800XEs were sold in Europe, they
should take 220/230v AC down to I suspect 5 and 12V.

The seven pin socket takes power as:

Pins 1,4,6 - + 5V
Pins 3,5,7 - Gnd
Pin 2 - Shield.

It is arranged, from top right, clockwise:

Pin 6,1,4,2,5,3,7

>-what other power supply can i use, will the c64 adaptor work for
>instance?

Unlikely. IIRC, the C64 has 4 pins.

>-the c64 adaptor lacks a few pins whereas it does go in a 7 pins port as
>well, is this the same whith the 800xe?
>-what do you all suggest i do besides looking for another 2nd hand
>adaptor?

Find an adaptor. All Atari models except the 1200XL (never sold in
Europe anyway) are the same.

>So as you assumed, i have to add the Atari 800xe to the list, as someone
>mailing me already stated. (and other Atari cpu's??) so again i have a
>few questions
>-what are the best 800xe emu's and where do i get them

There isn't a specific 800XE emulator. Do a web search on Atari800Win
and you will find the best, most reliable, freeware Atari emulator ever
made. It even runs on my Win2000 system.

>-where can i find Atari 800 XE Games Pages with games for download to
>use with the emu's

There are a couple - a web search should help, as I can never remember
the URLs.

>-where can i get the OS-roms

There might be some information about this on the Atari800Win page.
coughs ;).

Here is the pin-out for the power connector port (looking at the computer):

V Notch at top
7 6
3 1
5 4
2

Pins 1, 4 and 6 are all +5vdc
Pins 3, 5 and 7 are ground ("earth" in the UK)
Pin 2 is shield ground.

You need 5vdc at about 1.5 amps. Any good, low-ripple supply will work (I run my Atari off a supply pulled from an old 8088 PC).

Thanx, Thanx, Thanx,... for all the info and help already,

you see, thats what i like about the newsgroops, the best of people are on it, knoglegde sharing rules!!!

Well, i'll be off then finding the adaptor of any kind saying atari adaptor. or if i can't find any i might buy one online if not too expensive combining send costs.

and secondly i'll be off updating my site with a nice atari cpu emulator and nice links to it's games pages!

Thanx again for the help

Greetings from Gnomula at:

3759. PC to Atari File Transfers

Newsgroup: comp.sys.atari.8bit
Date: 2000-06-16 00:00:00 UTC
From: Michael Gale <mgale@bitflash.com>
Message-ID: <wMr25.5177$Rz5.187540@news.magma.ca>
Source record: 44126

Hi,

I recently purchased and installed a 5 1/4" floppy drive on my PC. I read in the Atari FAQ that:

"The following is generally true in the PC world:
- disks written on 360k drives can be read on either drive
- blank disk formatted and written on 1.2M drives can be read on either kind
- disks written on a 360k drive, and overwritten on a 1.2M drive, can be read reliably only on a 1.2M drive.
- disks previously formatted on a 360k drive, or formatted as 1.2MB, and then reformatted on a 1.2M drive to 360k, can be read reliably only on a 1.2M drive.
(all this assumes you are using DD media, not HD)."

When I format a DD Disk on my PC using the appropriate format options:

Format A: /F:360

Once the format is complete, the resulting disk is not readable by my Atari 1050 floppy drive, and when I format the disk on my Atari drive, the format is not readable by my PC drive. So, one of the questions I have is how do I format the disks so it is readable by both drives, but only writable by one of them?

My second question has to do with the DCM format. Once I UNARC the file on my PC, how do I unpack the DCM file, so that the appropriate files and directories are created? Do I need to extract them on the Atari?

Perhaps it might be more clear to you if I give you an example:

I want to take an Atari OS I downloaded onto my PC, which is compressed using the ARC format, and extract the files from the DCM format so when I use the disk on my Atari, it will boot the OS.

Any help would be appreciated.

Michael

Source record: 44127

Hi Michael,

Please bear with me as I'm very rusty and by no means an expert.

In order for the PC to read an Atari formatted diskette, I believe a utility program must be running. I believe in the Atari FAQ it lists a few that can be used. There is also one relocated at the following site:

http://nleaudio.com/css/Files.htm

I have had some trouble downloading files at that site using Netscape. It simply wants to open the file as if it were a text file. I can't seem to edit the type in my preferences so that it will want to download it. If you use Internet Explorer you shouldn't have any problem. Anyway....

Running this utility on the PC, you should be able to read an Atari formatted diskette. Then you can copy the file from the PC to the Atari diskette. Stick the diskette back into your Atari and run the unarc program to unarc the file. At the site listed above is another Utility called Disk Communicator. When you download it, it is in ARC format also so you'll have to un-ARC it too. This is an Atari program that will un-"DCM" the .dcm file.

I hope this helps you out.

David

Most of the utilities are for modified 1050s, those that can handle 256
bytes per sector.

I did write a quick and dirty set of programs for transfering files from an
IBM to stock 1050, but unfortunately all the files at archive.umich ended up
with a 1 byte length difference after transfer which broke them. I don't
have the originals around anymore, so it may be hard to find a working copy.

Most people nowadays just opt for an SIO2PC cable, it is a much more elegant
and universal solution to many problems.

3764. Where to get Pilot Commands

Newsgroup: comp.sys.atari.8bit

Usually true.

> - blank disk formatted and written on 1.2M drives can be read on
> either kind

Only sometimes true.

> - disks written on a 360k drive, and overwritten on a 1.2M drive,
> can be read reliably only on a 1.2M drive.

Since you included the "reliably" qualifier, this is always true.

> - disks previously formatted on a 360k drive, or formatted as 1.2MB,
> and then reformatted on a 1.2M drive to 360k, can be read reliably

> (all this assumes you are using DD media, not HD)."
>

It's doubtful a 360K drive would work correctly with a HD disk regardless
of any previous format. Formatting DD disks to 1.2MB is possible with
additional TSR's installed such as FDREAD or 2M (both available on
Simtel).

> format the disks so it is readable by both drives, but only writable by one
> of them?

/F:360 gives you a double-sided format with 512-byte sectors accounted
for by MS-DOS as two sectors per cluster (aka allocation unit). There is
no way you're ever going to get a 1050 to read PC-formatted, double-sided
disks or even to handle the 512-byte sectors. The only double-sided disks

you can read with a 1050 (assuming a double density upgrade) are those formatted in a XF551 in which case, the 1050 could handle the first 720 of 1440 sectors.

The MS-DOS format, aside from sector size, is incompatible with the XF551 format also because the MS one places alternate sectors on opposite sides of the disk i.e. to read cluster #1, you read sector #1 from side A and sector #2 from side B (done this way for speed). The XF551 format places sectors 1-720 on side A and 721-1440 on side B thus permitting access to side A by a single-sided, double density drive.

There are a few programs which are supposed to let you access Atari-formatted disks with a PC drive. My experience with them was that only disks formatted on a XF551 using MYDOS could reliably be used with a PC 360K drive.

>

Generally, yes; use Disk Communicator by Robert Puff.

Your best bet is to transfer the file via SIO2PC or APE. Alternatively, you can use DCM2ATR on the PC and produce a disk image which will still require a SIO2PC cable and one of SIO2PC or APE for use.

Hi Michael,

Oops! Yes, that is correct. Try this link instead:

http://www.newbreedsoftware.com/xlsearch/xlsearch.cgi
Type spartados into the search box and press search. Look for a download
called myutil.zip. I think that's the one you want.

Richard Cortese brought up a good point, one that I failed to think off. The
stock Atari 1050 formats disks with 128 byte sectors. The only utilities
I've seen write 256 byte sectors. If your 1050 is stock, the SIO2PC may be
your only hope.

Source record: 44137

The color signals going to your color tv are frequency modulated so that they will work with your tv tuner. The signals going to your monitor through a 5 pin DIN connector in the back or side of your computer are; Luminance (pin #1), Composite Video (pin #4), Ground (pin #2), a different Video signal (except for XE) (pin #5), and Audio (pin #3). Audio and one of the video signals connect to your monitor through RCA plugs. If you have color output on your tv, I would say that your color circuits are working. I would look for an open in either the DIN plug or the RCA plugs. If you can't find it there, then there has to be an open circuit in the DIN jack in the computer.

Audio/red---- #3 * * #1----brown/Luminance

NC/white----#5 * * #4----black/Composite
Video
ground/green----#2 *
I hope this helps you out.

Body handling: HTML body converted to readable text

Actually, I feel the Apple MAC has that good feeling. I've been
an Atari 8bit head for many many years. I started getting out of it in
the mid 90's. The PC world made me puke and I passed over that for BSD
Style Unix. I fell in love with that... but, it wasn't until I started
playing with Macs that I got that good old feeling again.

3781. Replacement power supply for Atair 1050 disk drive?

Newsgroup: comp.sys.atari.8bit
Date: 2000-06-17 00:00:00 UTC
From: John & Cindy Linskey <cjlink@mindspring.com>
Message-ID: <8igpeaoie1@slb0.atl.mindspring.net>
Source record: 43951

I recent acquired two Atari 1050 disk drives without the power supplies. I am hoping that Radio shack's universal power supply would work with the drives, but would like to know if anyone has found a replacement for the original units?

Another questions that I need answering, is rather or not 5 1/4 double density disks IBM formatted would be compatible with the drives?

Thanks in advance,

John

IIRC, any soft-sector disk will work. HD discs are perhaps even more
use, as you can flip them (they should have an extra notch on the
opposite side, although it's a /long/ time since I've seen an HD 5.25
floppy). Hard sector discs mess up the timing...

Don't know about RS univerals, but all you need is 9VAC at about 3 amps.

RS labels their transformers a little funny, something like 12VAC will be a
12V center tapped @6.3 volts or something like that. IMO: Stick with
something as close as you can to the 9VAC/3amps. You can hack a PC power
supply into the drive, only takes something like 3 solder point and an
connector, but it is an act of desperation.
>

Soon as you reformat them in the Atari.

Doesn't the floppy board for the BB handle ms dos disks with a reader
program?
I think the xf551 with a CSS upgrade also can handle ms dos disks

formatted at 360K. Although the sector is handeled as 2 halves.
I beleave Happy can handle ms format tho with 256 byte sectors.
Shouldn't too hard for 512 byte ones.

Can the pc format disks at 180K?
Would make in intersting project for supermax. Readiing/writing 512
byte sector disks. It has enough ram.

Composit chromanice (colour) isn.t connected in the 800XL.
Use composit video instead like on your XEGS.

These images are generated by some sort of EXE-to-ATR converter and
are all broken. They report the wrong size in the ATR header, which
confuses some programs. I had to fix APE to work with these a long time
ago.

I think it was the memory costs, it sure impressed me. OS/2 2.0 was pretty
popular for a while, but people still complained it needed too much RAM...
I even saw OS/2 1.3 as a student. It looked pretty cool to me, and I
remember
being impressed by it's segmentation (Can I admit that without being
shot)...
Not that it was 64K segments but that the memory bounds checker would
trap on byte boundaries. It was one of the few programs that actually used
the 286 segments correctly...(from memory)... Version 2.0 was the 386 only
version and it was extremely stable...

One thing that did suck was the number of floppys it took to install. It
was over
20 3 1/2's from memory... Actually I take that back... I rarely had to
reinstall it,
so I guess compared to Windows 9x's which requires regular reinstalls it
wasn't
so bad...

John,

I still have several NEW power supplies for the Atari 1050 disk drives (in original boxes). You can have them for $10 each plus shipping. I also have several USED ones available, priced at $5 each plus shipping. Reply in Email to s.winick@worldnet.att.net if interested.

3796. SpartaDOS basic commands

Newsgroup: comp.sys.atari.8bit
Date: 2000-06-18 00:00:00 UTC
From: "Foster L. Putman" <fangmans@bellsouth.net>
Message-ID: <394CC8E5.4251761D@bellsouth.net>
Source record: 43963

Can some one give me the basic commands for Sparta DOS? I have a disk
with Sparta DOS and don't know how to get it to delete files, format
another disk and so on.
Thanks
Lee Putman

3797. Re: A new SIO2PC/APE survey

Newsgroup: comp.sys.atari.8bit
Date: 2000-06-18 00:00:00 UTC
From: llpwhite@cs.com
Message-ID: <20000618124050.04759.00002142@ng-ba1.news.cs.com>
Source record: 43964

Here are the survey results. I'd like to thank everyone who responded. There aren't any results that jump right out at me, because the answers provided varied quite a bit relative to the number of responses. I also had to do a little "creative interpretation" in a few cases, based on the answers provided (did my best to reflect what was said within the framework of my questions). Larry

1. Do you normally use SIO2PC or APE?
2-ea APE, 4-ea SIO2PC

2. If you use APE, what version do you use?
Dos, APE98

3. Do you have a real SIO drive on line at the same time your are using an SIO2PC or APE drive?
Yes from all 6
Some used only one real drive, and some had more than one.

4. Is your Atari NTSC or PAL?
NTSC 4, PAL 2

5. What type of PC do you use -- 8088, 286 or 386, 486, Pentium or better?
8088 - Pentium/Better (A little of everything, including multiple computers)

6. Do you run (a Dos version of) SIO2PC or APE under MS-Dos or Windows 3.X or W95/98/2000? (This is certainly doable with a fast processor).
No from all 6

7. Are you able to run a REAL Atari drive in high speed mode without errors on either the Atari drive or the PC Virtual drive? (US Doubler, Indus, XF551, Happy, etc.)
The SIO2PC users all said YES
The APE users were split 1-Yes, and 1-No

8. If you are able to run at high speed SIO on a real drive, and you are using APE, are you using 2X or 3X?
The only person indicating "Yes" could run up to 3X successfully.

9. If you are able to run at high speed SIO, what type of a high speed Atari drive *and* high speed driver are you using?
The drives varied quite a bit, although most were some form of an enhanced 1050, and the most common driver was Sparta 3.2X or 3.3X, followed by the Black Box driver.

10. If you are able to run at high-speed, what type of cable are you using -- MAX232 (type), 1489/14C89, or something else. (Please specify one-chip or 2-chip design).

MAX (2-chip), 74LS00, 4049, 2-ea. Max 1-chip, 1-ea 1489/14C89-type.

3799. Re: SpartaDOS basic commands

Newsgroup: comp.sys.atari.8bit
Date: 2000-06-18 00:00:00 UTC
From: "David A. Paterson" <david_p@storm.ca>
Message-ID: <8ij4csnds1@news.storm.ca>
Source record: 43966

```
Quick command list for SDX:

ARC - ARC program
ATR - attributes
BASIC - go to internal BASIC
BOOT - select file to boot on disk
CAR - run cartridge
CHDIR - change directory (also CWD and CD)
CHKDSK - check disk
CHTD - change time date
CHVOL - change volume name
COLD - cold reboot
COMMAND - Sparta's COMMAND.COM
COPY - copy files
DATE - set system date
DIR - show directory (also DIRS - short directory)
DUMP - show file in hex and ASCII
ERASE - also DEL and DELETE
FIND - looks for filename on all drives unless drive number specified
FORMAT - formats disk
KEY - on or off
LOAD - loads file (does not run)
MEM - shows current low memory limits
MENU - much like Norton Commander with only one panel
MKDIR - make directory (also MD)
PATH - set path to search for commands that aren't internal
PAUSE - for batch commands' wait for a keypress
PEEK - like the BASIC command
POKE - like the BASIC command
PROMPT - set command prompt
RENAME - renames file
RMDIR - deletes empty directory (also RD and DELDIR)
RS232 - loads RS232 handler for PR Connection or 850
SAVE - saves binary data
SET - sets environmental variables
SWAP - swaps disk drives
TD - Time/Date display
TIME - set system time
TYPE - roughly the same as copying to the screen
UNERASE - restores previously erased files, if possible
VERIFY - turns write verify on or off
X - executes programs that require no carts installed

To run programs like Turbo Basic XL, custom CONFIG.SYS files are required.
Options for CONFIG.SYS include:
```

USE - specify OSRAM, BANKED or NONE. Where SDX will have its secondary RAM area. For programs that use the OSRAM area (such as Turbo Basic) specify BANKED. This will cost you one of your expanded memory banks
DEVICE SPARTA - required. Can add number of buffers (optional) default 4 and optional max number of files open default 5
DEVICE SIO - required. Permits high speed SIO with drives that support it, regular for all others.
DEVICE INDUS - optional. For Indus drives. Enables Syncromesh
DEVICE ATARIDOS.SYS - Optional. Lets you read DOS 2.X format disks including MyDOS
DEVICE RAMDISK - Optional drive number and optional number of banks to use. Default doesn't use the 130xe banks, leaving them free for other programs
DEVICE CLOCK - for the RTime8
DEVICE JIFFY - for when there's no RTime8
DEVICE XEP80 - XEP80 driver

The actual manual is over 100 pages; I have neither a scanner nor a touch-typing ability, so this very brief overview is all I will do. If you have any specific questions I'll do what I can to help.

For the disk version, many are the same except format can also be INIT and XINIT (Sparta disks) or AINIT (DOS 2 compatible disk); a DIR of all the .COM files on the master diskette gives you a good idea of the external commands. Greater than (>) is the path delineator going down and less than (<) coming back up.

There is also CREDIR, DELDIR and TREE for directory maintenance; PROTECT and UNPROTECT for files and LOCK and UNLOCK for disks; SPCOPY, XCOPY, and DUPDSK as utilities.

-Ron

I don't have a solution but I admire the problem.

3802. Re: Replacement power supply for Atair 1050 disk drive?

>Richard Kilpatrick (PC)" richard@lovecraft.demon.co.uk replied:

>IIRC, any soft-sector disk will work. HD discs are perhaps even more
>use, as you can flip them (they should have an extra notch on the
>opposite side, although it's a /long/ time since I've seen an HD 5.25

ANY 5.25 will usually work in the 810 or 1050 and the power supply is 9 volt AC
and 1.5 to 3 amp.

In the US, HD 5.25's (1.2M) disks have no differentiating extra notch and can
only be flipped when one is added or the drive is write protect modified.

>floppy). Hard sector discs mess up the timing...

The 810 and 1050 pay no attention to the hard sector timing holes; The XF551,
Percoms and some other aftermarket drives, however... are a different matter.

-Ron

I don't have a solution but I admire the problem.

Here is a web site that you should consider trying
out if no one sends you the mac65 rom image:

http://www.newbreedsoftware.com/xlsearch/

It is a search engine that is designed to locate all
Atari XL Series computer programs on the web.

XL Series is mostly the same as the 400/800 for
they are both Atari 8-bit computers.

I have an Atari 800XL computer in which I have
archived because of floppy drive problems.

My experience is that HD disks do not work correctly with Atari drives but
that the 1050 does indeed ignore the extra holes in hard-sectored disks.

The 800XL did not connect the CHROMA cable on the connector. Instead of COMPOSITE, LUMA and CHROMA, you only have COMPOSITE and LUMA (black and white). If you have the 130XE hooked up properly (using what you call the RGB cable...), just swap the CHROMA with the COMPOSITE and it will work fine.

The 130XE uses LUMA and CHROMA - the 800XL has to use LUMA and COMPOSITE (which will also work on the 130XE, but the signal quality is better with LUMA / CHROMA)

Bob

Yess, I have now added the Atari 8-bit to my site as well, thanx to you guys & girlz out here in the newsgroops. I know, afterwards it was simple, but i never really let my eye fall on Atari 8 bit emulation until i bougt an old 800XE at a market in Holland with 4 carts for $7,- and that offcoarse got me curious. Now i am almost ashamed that it took until now that i added the great Atari 8-bit emulation to my page.

I offcoarse offer everyone the Up-to-Date Emulators (but without doubt it is Atari800(Win,dos,mac) that rules big time, me using the Windows one), All needed Os&diskroms in one ready to go zip, and i have a direct Linx-List to the games Pages. (P.S. Disks on my 800 XE, so i guess i need a diskdrive????, sorry for my ignorance i should read better always, but...)

Anyone know how to get around the .dcm bug download with Netscape, or is it just as simple that i have to use another browser like microsofts explorer?

These are the Direct Linx To Games Pages i offer my visitors:

ftp://ftp.spudster.org/pub/Atari/CTH/Games/ATR/
ftp://ftp.spudster.org/pub/Atari/CTH/Games/DCM/
http://homepages.ihug.co.nz/~aaronat/atari.html
ftp://atari.fornax.sk/pub/atari/8bit/Games/

I will offcoarse search for more myself,... but iff anyone has info on great sites with those lovely .atr's & .dcm's etc. and is willing to share it with me i would be very happy, i will than instantly add them to my Atari 8 Bit Games Pages site at my Homepage: Computer Emulation.

I wanna again thank everyone for helpin me out with the 800xe and with the emulation info.

Greetings Gnomula at:
http://members.fortunecity.com/computeremulation

Hi all,

I'm in the process of researching a book about the "golden" home computer years (1980-1990, roughly), with a focus on the european scene, and I would very much appreciate any assistance I could get on the following:

- The companies and people behind the machines: company histories, financial data, developer bios, and, dare I hope, contact addresses of people involved in the development of any of the popular home computers

- Magazines, reviews, product catalogues and promo material (for scanning or photographing)

I'd also be very interested in infos about machines that were limited to a certain market (Thomson TO/MO series, etc...) and all those machines that didn't quite make it (like the Enterprise 64/128, etc...)

Also, if anyone is/was involved in demos and user groups, I'd be more than glad to hear from you.

Thanks a million in advance, and apologies for the cross-posting
Robert

I just found out a couple of days ago, quite by accident
that the Atari Jagfest 2000 is a go.
In fact, its this coming weekend, June 24th, 2000.
It is at the U.T. Student Union Building. 10Am to 11Pm. $10.00

Bring your Jaguar, with Battleship to compete, and probably a
small TV.

And bring your Lynx too!

See the site at:"http://jaguar.holyoak.com/jagfest/jf2k.html".
or my link at "http://people.delphi.com/rldetlefsen/".

I'm having a problem 'saving assembly source code out to the disk drive.
I have the guide for MAC65, using what it says doesn't work. "SAVE
#filespec" is supposed to save the tokenized user source file to the
specified device (in this case D1:). it doesn't work. Using the Atari
Assembler Editor (I have no DOCs), I come up with the same thing,
nothing works. Both assemblers assemble source files, list, auto number,
and so on so one would think that there is nothing wrong with the
software. It must be something I am doing wrong. Any ideas?

Try changing to LIST command instead. The save option is for saving a memory region.

There are a few other things you may not be used to, for instance the MAC defaults to the no object option, you have to turn it on to even generate code. Before you turn on the .obj, all you are doing is syntax checking.

You will also probably want to compile directly to and from a disk file, at least I like to for larger programs.

If you are using quotation marks as per Atari BASIC, then that's your
problem. Output options for MAC/65 source code are:

```
SAVE #Dx:filespec ; save tokenized
LIST #Dx:filespec ; ASCII save with line numbers
PRINT #Dx:filespec ; ASCII save without line numbers
```

Input options are:

```
LOAD # ; load tokenized
ENTER # ; enter listed source
ENTER #Dx:filespec,A ; enter unnumbered source
```

LOAD may have the filespec followed by ,M to merge.

Sounds like a good idea - with the SIO2PC, a great idea :)

I'd certainly buy one under $40. Would it work with compatible drives,
though (ST systems weren't often sold with dual drives here, but there
were many which used a standard Shugart type 3.5" drive).

>If not, something may be fried.

This usually works only a couple of times and for a short period. Best Electronics has replacements for both types of the XE mylar. That's the sheet of plastic inside the keyboard. You have single layer and double layer versions. Sugiyama (or something like that) and Action Technologies (IIRC) both use the same double layer mylar. The other brand (which starts with an M I belief) uses a single layer. Brad of Best Electronics has these single layer mylars specially made, because the once Atari used are really bad. Single layer and double layer sheets are not interchangeble (because of the keyboard construction). Last time I heard/looked, both versions cost 22 (Twentytwo) US dollars. I tried both versions. Never had one go bad on me yet. BTW I looked at all my XE's. Only one had the single layer mylar.

Robert,

Try one of my pages about Memotech MTX systems. There's a wealth of data on
there and I also have some of the original 8" factory disks and the drives
to read them on.

John

If you RAMdisk is big enough try using that. IIRC Mike Jewison did something like that to play Alternate Reality and wrote about it in Atari Classic (in the Ben Poehland era)

3835. WTB : Centronics Printer I/F for Atari 800XL

Newsgroup: comp.sys.atari.8bit
Date: 2000-06-21 00:00:00 UTC
From: paul.barker@orange.co.uk
Message-ID: <8iqjdn$764$1@nnrp1.deja.com>
Source record: 43905

Hi All

I'm looking for a centronics printer interface for an 8bit Atari.
Probably for use with Mini Office II.

I am in the UK so would prefer to source one over here, but I have no
problem buying from anywhere. I would appreciate only working units and
if any s/w is needed that it be included.

Cheers

Paul

Sounds great, I could stop hunting down blank 5 1/4 inch disks. Makes
my life much easier, I'd be happy in that price range as well.

Thats not true: I own and sometimes play AR the city+dungeon. it works
with 48k RAM & 64K RAM (the city) and 48k,64k,128k RAM (the dungeon -
allthough the label on the package says minimum=64k RAM !!). The city
supports 2 drives without problems (if they are switched on, when the
bootdisk (disk 1 side a) is booted). The dungeon even supports 4 drives
if you have so many...

(Of course sometimes you still have to swap disks, because the city has
4 disk sides, the dungeon 5 disk sides; 2 read/write heads are not
supported !! maybe AR does not like certain floppy drives, like XF551
and other floppy drives. only the dungeon supports a 64k Ramdisk;)
greetings - Andreas

3839. Cartridge traders wanted

Hello michael,
Atari and IBM PC have different formats, thus it is impossible to use
one floppy format for Atari and PC (unless you have some special
program, which I might not know to exist). So, you can only use Atari or
IBM PC format...

DCM is the extender for Bob Puffs Diskcommunicator (uses *.DCM, *.DC3
and *.DSK as common extenders). So boot up the diskcomm 3.2 to unpack
these "files".

An Atari OS is always hardware - a normal Atari only boots the OS when
inserted as a ROM or Eprom (its not an Atari St with [T]OS on disk). So,
if you do not have any patched/changed Atari or any special software,
you cannot boot the OS from disk. The arced and diskcommed Os is just
there for backup reasons, so anyone can make ROM/Eprom backups easily or
use the Os with some emulator...

greetings - Andreas

For me, Netscape only works with *.ZIP files. It is also unable to download *.ARC, *.DCM, *.XFD, *.ATR and other uncommon compression formats (uncommon for Netscape). It does download these programs without any errors (holding the shift key or pressing the right mouse button), but if I try to unpack them at home, I end up with dozens of errors (CRC checksum error, ...). Thus, for downloading atari 8Bit stuff I use Internet explorer, although I don`t like it. But its the only solution I have at the moment (since Netscape does not work properly).

greets - Andreas

P.S. We have and use Mime (here at university) and other important things fow download, still Netscape does not work correct in these cases...

>
> James B

Yes, the BB can read MS DOS disks with a special reader program. The XF551 with BOB Puff or Stefan Dorndorf OS upgrade can also read 360k MS DOS disks with a reader program. An XF351 (upgraded XF551, with 3,5" drive) and installed Bob Puff or Stefan Dorndorf XF upgrade can also read 720k MS DOS disks with a reader program. And finally a Happy can read 180k MS DOS disks with the Happy master disk (and its IBMREAD program). MS DOS can provide 180kbyte (or it could at least - in the old days). I am not sure, if there is already any floppy drive or program to read HD (1440kbyte) MS DOS disks. Maybe the german HDI from Erhard Puetz can do that or the BB also ?!? greets - Andreas

P.S. Isn`t there any way to upgrade a 1050 with two read/write heads ?? (like in the 1450XLD) - And with some special hardware (like Happy, Speedy and such, using Cache buffers) or software, still no way to read 512 bytes per sector ?!?

>I have the guide for MAC65, using what it says doesn't work. "SAVE
>#filespec" is supposed to save the tokenized user source file to the
>specified device (in this case D1:). it doesn't work. Using the Atari
>Assembler Editor (I have no DOCs), I come up with the same thing,

don't see any syntax error on the MAC unless you are including the quotes. LOAD & SAVE#filespec is correct for tokenized source code and BLOAD & BSAVE#filespec for assembled object code.

The ASMED uses different conventions; you must LIST & ENTER#filespec your atascii source files; an appended comma M (ENTER#filespec,M) will merge the load with existing source without clearing the text buffer. LOAD#filespec retrieves object code to address from which it was assembled. The save command requires the less than symbol to precede the hex address (SAVE#filespec<0600,06F7)

-Ron

I don't have a solution but I admire the problem.

Curt,

Staying busy in the atari Scene still I see. Excellent. Yes, since my
hobby seems to be all about bridging the Atari8/ST gap, I would love one. I
could even furnish a SX212 to be refurbished. A noble use for a 1200 buad
modem.
Would the drive have the ability to be used as a Atari 8 or ST drive? If
only Atari8, that's cool with me.

Would you need an interface for every ST drive being used?

What kind of formats would the ST drives allow? Double, extended, even
quad density?

Thanks again and zot me down as one of the 100.

3846. olumn term program like Bobterm?

Newsgroup: comp.sys.atari.8bit
Date: 2000-06-21 00:00:00 UTC
From: Greg Goodwin <Greg.Goodwinp0.f2.n8.z8@fmlynet.org>

Source record: 43916

FamilyNet HQ: Telnet:\\www.family-bbs.net

(Sorry for posting the last message four times... server hichuped I guess) :)

Well, I'm in the market for a terminal program that has 80 columns, ANSI
& ATASCII, and the abilities of Bobterm.

Ice-T offers 80 column.
BobTerm offers the awesome macros.

I tend to switch between the two, but I'd like to know if there is a
term program that offers the best of both worlds, and here's the kicker... at
48K (I use 48K 400/800 machines).

Any suggestions?

Doctor Clu

3847. ing an Atari 400 on 24/7

Newsgroup: comp.sys.atari.8bit
Date: 2000-06-21 00:00:00 UTC
From: Greg Goodwin <Greg.Goodwinp0.f2.n8.z8@fmlynet.org>
Message-ID: <0002.39510d2e@fmlynet.org>
Source record: 43917

FamilyNet HQ: Telnet:\\www.family-bbs.net

Well, I have recently assembled from various parts an Atari 400 w/ 48K
that I wouldn't mind if it blew up. (I have the ones I care about stored away,
and this one is good for testing stuff, having fun with, etc)

I use an Atari8 now days as a quick way of checking E-mail and newsgroups
through a local server when I'm at home. I figure if I leave it on that is
less wear an tear on disk and hard drives (unless I REALLY need them, then I
power them up at that time.)

So here are some power questions:

With leaving an Atari 400 on 24/7 what kind of power would that pull over
an extended period of time? How would this pull compare to an alarm clock or
VCR that is plugged in all the time.

What components of a 400 (or Atari8) are likely to go out with extended
use like this?

How are those components effected by extended use verses the computer
power spike when a computer is first turned on? Which is worse overal for the
computer in the case of the Atari8? Being left on, or turned on and off on a
daily basis?

Thanks in advance,

Doctor Clu

Whoaa.. "always" is a long time! Are you including the Translator Disk for the XL series as 'special software'? It boots an altered OS through means other than hardware.

-Ron

I don't have a solution but I admire the problem.

Don't give in to the dark side....

How about a dual atari approach ?

I've been lurking as usual and an idea 'popped' into my head...
Here's some things I'm guessing:

1. Most people with atari 8 bits have more than one (You just cant help
picking up another cheap one)

2. PPP is do-able on an 8 bit...(I'm pretty sure Commodore people have done ppp))

3. Joystick networking is also doable...

Why not stick the 3 above things together. Write a program that runs one atari as a dedicated ppp to joystick gateway.
Hook up the other atari to the joystick ports and then you could have one machine take care of all the crunching required for ppp, and the other can just happily suck data from the other box...
If you were really smart you could implement the PPP code in a cartridge and make it work ok on 16K machines... So your gateway is a diskless self booting system...

You could also offer a disk version for people who didn't want to fork out for
the cartridge...

That way you pull out your old atari 400, slap the cartridge in it, plug a couple
of cables into the joystick ports on both machines and hey presto an all atari
solution.

Once your done, unplug the cartridge and joystick plugs from the 400, slap star-raiders and your stick back in and your back in zylon heaven.

Rebutals, comments, suggestions welcome
Peter

Hmmm... so what if you copied the disk sides onto virtual disks, and had
four virtual drives going at once with a SIO2PC or SIO2ST setup?

Curious, (and may have to try this...)

One of the best ideas for the 8-bit I've heard in a while. With so many problems out there with the 1050 and with so many ST drives out there, why didn't anyone think of this before. A lot of people could not only use this but also afford it. Count me in as well.

> 512 bytes per sector ?!?

I don't have all my 1050 SAMs manual around anymore, but the only chips in a stock 1050 are the 6507, 4k ROM, 128 byte RAM, 6532 RIOT chip, and the controller. Since the 6507 can handle 8k of address space, I would bet on the ability to upgrade a 1050 if someone wants to. IIRC a couple of addresses are not fully decoded, kind of like the PIA in an 8 bit takes up a full page, but really only needs 4 bytes.

IMHO: At this stage it would be hard to support for several reasons. It makes sense to only put maybe 2k of RAM in it, but I don't even know if they are still making them that small. Almost all PCs only have a 3.5" floppy now, so 5.25" disks and drives are getting hard to find.

When I just did a 1050 upgrade to double density, JDR no longer carried the 6810 RAM, I had to pull one out of another drive. We are going to be running into more problems like this, ok for us but I don't see a lot of people that are interested on this level anymore.

Hi,

I just finished a classic gaming "Retro Reproduction" for the Atari 7800 called the 7800 High Score Cartridge. Now I'm looking to do another hardware project. What I am considering is an interface to allow all Atari 8bit computer users the ability to use Atari ST SF314 & SF354 disk drives on their Atari 400/800, XL/XE computer systems.

The XE2ST interface will be inside of the old Atari SX212/XEP80 interface case and will allow an Atari 8-bit to plug an SIO cable into the back of the unit and allow an Atari SF3x4 disk drive to plug into the back of the unit as any drive from 1-4. Now Atari 8-bit users can use 3.5" high density diskettes and more importantly use Atari made disk drives which are abundant and cheap. I've always thought that Atari itself should have designed this very product and sold it as it would have helped bridge the gap between XE and ST users by allowing the use of peripherals by both computer communities.

I'm willing to do a run 100 units if there is enough interest. I'd like to keep the price down to somewhere around $30-$35 or so. The idea is a simple interface, no bells and whistles, no suggestions on ZIP disks, hard drives and so forth, just a simple interface to allow the use of stock Atari SF314/354 disk drives. The only option I may consider is building an SIO2PC interface into the unit.

Please send me some feedback and if enough people are interested and its a favorable response, I'll start work on this and have it done in about 2 months.

Curt

I make my PC do 180K formats on my 360K drive with:

Format b: /1/4 but only in true (boot to) DOS mode. DOS windows
won't work!

Then I can copy some web stuff to it in DOS mode again, take it to my
Happy and convert away. I'm pretty sure the 180K format is using 512
byte sectors. Going from Happy disk to PC, the files can be copied
using windoze with no problems, but the other way around is no good
without the DOS mode. The lack of the second FAT on a single sided
disk throws windoze into fits if its supposed to write to the disk.
You just wind up with garbage. If that's not bad enough, windows then
wants to launch scandisk on it which really does the disk in.

: You can tell because the Jaggies have green space helmets. DUH!

That's true for the earlier levels. As the game progresses, all pilots have the white helmet and you must wait for the door knock (which makes the game still frightening because you don't know what you'll hear--the knock or the Jaggi leaping at the windshield!).

Andre <stein@agnld.uni-potsdam.de> wrote:

: Rescue on Fractalus was first released on disk and cassette by Epyx in US and
: Aktivision in europe in 1985. The cart version came later (remake by Atari to boost
: the XE Game System which was released in 1987 if I remember right).

There another story to this. In 1982, Lucasfilm and Atari had an agreement (quite big news at the time), in which Lucasfilm would develop games for the Atari system and computers (and for which Atari would be exclusive distributor). Ballblazer and Rescue on Fractalus were the two titles announced, but by this time, Atari hit hard times and the projects went into limbo. It was actually intended to be cartridge releases, as Lucasfilm developed a bank-switching routine so it would run on all Atari computers. But that didn't happen, and when Tramiel bought Atari, he sold off the rights to the games to Epyx.

Fractalus was one of the very first programs to use the fractal technology for the home computer, incidentally. But by the time the game was finally released, fractals were already commonplace. I seem to remember that around 1985, IBM was bragging on TV commercials about how their scientists created fractals on their computer and decided it could be used in analyzing cancer cells...

Hello Everybody,

I am looking for the following titles to help
complete my Atari 7800 collection:

JINKS - (*Missing Number)
MAT MANIA Challenge - (*Missing Number)
CRACK'ED - CX7836
SUMMER GAMES - CX7826
WINTER GAMES - CX7831
COMMANDO - CX7838
FIGHT NIGHT - CX7851
DIG DUG - CX7803
IMPOSSIBLE MISSION - CX7832

I chose to include catalog numbers to make
it easier to find the games.

Amateur Atari historian and Devout Atari game player,
Wally

For some reason the original post is not yet on the news server
of my provider. so I cannot reply to the original message, but
I wanted to reply to this message anyway:

Actually, the HDI interface from Erhard Puetz already does this.
I have two of those.
The HDI is a high density floppy controller unit that allows attaching

almost any PC floppy drive, including 3.5 inch 1.44 meg.
Also, it has an Atari ST connector standard, so you can plug in
the ST drives right away.
You stated High density capability while the SF314 is only 720 Kb,
so only DD. Also, the SF354 only supports 360 Kb disks.
Anyway, try contacting Erhard. He already wrote the ROM stuff.
He made his stuff PD I believe.
However, the biggest problem he has is obtaining the floppy
controller ship. The WD floppy controller is sort of impossible
to get anymore.

Keep those XL's/XE's humming.

At last! My Rescue on Fractalus cartridge arrived...

Plug in the 65XE...
Set everything up nicely...

And it's like going back 10 years :)

Best of all:
The aliens still make me jump.

So what if the graphics are pixellated, the gameplay beats /anything/ I have on Playstation :)

Which leads to a question. Behind Jaggi Lines, IIRC, was dated 1984. My cart is dated 1987... why did it take 3 years for the game to reach the market?

Richard, just needs his 800XL and 1050s to have everything just right...
(Incidentally, Lord Chaso/Thimo Graef supplied the game - he has advertised here. It was just like new, still shrinkwrapped...)

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

> How hard would it be to turn PC-scenery disks to Atari scenery disks?

Depends on when they were released. I recall that the PC fl.sim. was
able to handle more commands than the Atari. (a FS scenery is more
like a program with if/jump/etc. than raw data, or at least it WAS).
I think that Fl.Sim.4 already included quite a lot of stuff which was
not supported by the Atari fl.sim (generic 3D surfaces, upwards air
flows, etc). I don't know if the latest FS98/FS2000 still use the
same format.
The very old scenario disks covering the US would probably work, the
more modern ones would require "cleaning", probably not impossible to
obtain something which works and is not missing most of the stuff, but
definitely not an easy task.

Bye,
Alberto

Rescue on Fractalus was first released on disk and cassette by Epyx in US and Aktivision in europe in 1985. The cart version came later (remake by Atari to boost the XE Game System which was released in 1987 if I remember right).

> Richard, just needs his 800XL and 1050s to have everything just right...
> (Incidentally, Lord Chaso/Thimo Graef supplied the game - he has

Except 'Choplifter' (Atari remake), 'Karateka', 'Summer Games' and 'Crystal Castles' all blue-boxed cartridges are quite easy to get in europe/Germany because they were mass-produced and the XEGS wasn't sold that good, so many many cartridges were left (in shrinkwrap)... in 1990 all Atari 8-Bit homecomputers were sold in Germany together with 10 (!) of the blue cartridges and the 'legendary' XC12 datasette for nearly $100 or something like that.

Greets,

Andre

Bad marketing? Though Atari was ahead of the times in many cases, it did tend to lollygag in others.

Heh... I was late into the Atari scene... I had Mac before I got an XL.
In all seriousness, I've got loads of PSX games which are playable, but
none of which I would miss especially, or play endlessly like Rescue on
Fractalus.

If only someone would take the basic elements of the game, keep the
responsive nature and simple controls, and just update the graphics, it
would be outstanding.

But...

They have to keep the silence before the 'rap rap rap' of a pilot at the
airlock.
Or maybe it's an alien...

Who can tell...

Richard (PSX version - add Doom[1] style mission once the search and
rescue mission was complete, to get into a Jaggi base and destroy it
before moving onto a new planet - and make returning to the mothership
under player control, so once they're beyond the atmosphere, they have
to shoot Jaggi craft (if there are any - perhaps on high levels?) and
guide the craft back to the mothership - but make these levels less
involved).

[1] Original doom. Another game that keeps my heart in my mouth...
combined with Rescue's ability to make me jump, should be a recipe for
regular cardiac arrest!

1 Atari ST Informer (Dec 92)
1 Atari Interface Magazine (May, Fall 92)

PD/Shareware Library:
168 PD/Shareware disks
All programs are archived
Each disk is categorized (Productivity, Communications, Games, etc)
15 Magazine cover disks
The library includes one set of master disks, and then anywhere from 1-3
copies of each disk
The library also includes two bound catalogs
One lists all files in alphabetical order with the disk number they
appear on
One lists all the files by disk number order

The web site for updates is a great idea. I'm also really curious as to what the hardware will be. Most ST FDC's were 1772 02 and 02-02, IIRC. These are also the chips used in the Floppy Boards. An 02-02 will do HD. But since the ST drives are *really* "dumb", there isn't anything to preclude using a modern PC controller chip? An even bigger curiosity (to me) is how this could be done so inexpensively. That would seem to dictate a very small board, and very few chips. I'll be following this with great interest!

>itself should have designed this very product and sold it as it would
>have helped bridge the gap between XE and ST users by allowing the use
>of peripherals by both computer communities.

I have a BlackBox with FloppyBoard, so I don't need such an upgrade, but I do have a couple of suggestions:

Make it possible to use at least two ST drives. That way you can copy directly from 3.5 to 3.5 Inch disk. Saves a lot of time and hassle.

Would be nice if it came with a utility to transfer files between Atari and PC disks (both ways). The BlackBox comes with such a utility, it is great.

Use a drive select switch. Either one of all ST drives (where the second ST drive would be one number higher than the first) or one for each (where the ST drives could be numbered 2, 5, 8). O yes, it would be nice if they could use drivenumbers 5, 6, 7 and 8.

Hope that helps. I'ld love to see your upgrade make it to the public.

I am not sure if I am leaving the original subject now (can't find the original
posting) but I saw at least two or three different Atari related vinyl singles
in record stores during the 80's.

I particularly remember 'Atari Baby' which according to a search now
was a Sigue Sigue Sputnik song. I thought it was some other pop/rock
band.

http://www.uvdaze.force9.co.uk/music.htm

If the original question was about vinyl singles produced by or in
association with Atari, then I am certainly off-topic.

Was def. SSS and off their first album. They also used to wear a lot of
Atari logo'd clothing and the logo was all over their album too. I used to
have some SSS t-shirts that were more Atari than SSS.

"Pacman Fever" was one of a collection of arcade-related songs
that came out in the early 80s by a band called "Buckner and Garcia".
They also had songs like "Do the Donkey Kong" and "Goiun' Berzerk".

They actually have a webpage with an online jukebox and ordering
info (CDs) at http://www.bucknergarcia.com/ ...

Hope this helps...

3901. Terrible Minolta Customer Service Reps

Newsgroup: comp.sys.atari.8bit
Date: 2000-06-23 00:00:00 UTC
From: Joe Kennedy <jsk@home.com>
Message-ID: <CRN45.17887$lU5.150871@news1.rdc1.nj.home.com>
Source record: 43818

This seems to be the place to warn others about terrible customer service. Now it's Minolta's turn.

Their RD3000, not a cheap camera, has a SCSI port that is covered by a cheap rubber plug that is not attached to the camera. simply sticks on to the SCSI port sometimes.

Now buy an RD3000 for big bucks; lose the cap within 6 weeks and Minolta offers to allow you to buy another rubber plug, with their customer service representatives insisting that it is your fault that the cap falls out not their design.

Well, you know how much it is the small things that influence what type of camera you buy. Guess what, after a Minolta 1500EX and an RD3000, probably won't be the next brand of camera I buy.

Minolta thank you customer service reps for another lost customer.

And thank you folks for letting me vent.

Joe

Dork. This is totally off topic.

And I have an RD3000. If you're too dim to keep track of the cover,
that's your problem - 80% of digital cameras on the market use these
covers.

Source record: 43826

With DOS 2.5, I found SETUP to not work well. I had to use the Basic POKE 1802..., DOS, Write DOS method. Much easier. I found that 2.5 and Setup would give me either two drives, or one drive and a ramdisk. But the Basic method gave me two drives and the ramdisk. Poke 1802,3+128 does this.(128 is bit 7(drive 8), and the ramdisk handler expects to be drive 8). There is a patch to make the ramdisk drive 4 at the same time it is drive 8 for software that only allows four drives.

Foster mentioned problems Saving Mac/65 files...

You didn't mention what errors were produced if any.
Did you check the disk to see if the file was written, what its
size was?

The obvious first question is:
Did you boot with a DOS disk?

To the best of my knowledge, there is no Atari 800 to SCSI interface. The upgraded 600xl, the 800xl and the 130xe (and possibly some European models - I'm writing from North America here) do have interfaces available for a HD at least - I don't think there are any CD-ROM drivers about.

Sorry I couldn't be the bearer of better news,

David P.

Sigh.

In good military terms, this is called situating the estimate.

Or, in easier language, deciding on results before doing a detailed
analysis.

Why a 65C816? Why 14Mhz?

Why 128K EEPROM for the OS? What is it that requires 128K? What memory
mapping would be used?

What is a "16 bit" sound processor? POKEY currently runs using 16 bits of
information for each channel; arguably, it already is a 16 bit sound
processor.

And so on, and so on... Proper analysis would be:

- decide what functions you desire;
- examine methods of implementation;
- assess methods of implementation;
- decide method of implementation;
- derive requirements from the method you decided to use.

Means XE-version 'in blue box' or just a later re-release of the game? As for the blue boxed games: I've never seen this title in blue box. The only thing I think to remember right was a silverbox release for 'Super Breakout' with a 'Plays on XE computers...'-sticker on it - but I'm not sure if it was really 'Super Breakout'. Sorry!

Yo! ivo, hows that Atari thang going, carmel from sunny? London, any
way Atari at the movies (or flicks as their also called)
>terminator 2's atari coding was actually source code for atari dos
cant remember what version, paul verhoeven must have been a director of
great taste, atariwise that is, because it also featured the atari
portfolio trying to hack into the security systems (try doing that with
ms), I suppose you could also consider the film D.A.R.Y.L i was told
that there was a scene with the main character play atari version pole
position at turbo speed, (was he using a pc emulator!!! only joking), I
suppose you could also being into the equation TV programs that
featured atari
A- An American TV sitcom called kate and ali, it used to be shown on
channel4 in the uk, the son (chip, nice americanism there) in several
episodes was seen playing the classic Atari800, no games where shown
B- Magnum, P.I, the one that had tom sellick in the lead role, one
episode had him holed up in a hospital, i think it was a coloured kid
that was shown playing defender on an Atari600xl, later in that episode
tom sellicks character was shown using the Atari600xl to hack into a
network or something
British Childrens t.v series (cant remember if itv or BBC showed it)
called chocki's children had two boys haunched over an atari 800
playing space invaders(atari conv) at turbo speed
The film paris texas had a scene in a U.S style covered shopping
mall/precinct, they were interviewing shoppers and i remember 1
particular person because he was carrying boxes of atari equipment
heading outside

BBC 2's open university program on 2 occasions had a program about the computer industry, it featured a firm selling OPD (one per desk) by ICL i think, and also Atari (when they were owned by the tramiels) and it was basically wittling on about strategy, marketing etc (what! STRATEGY! MARKETING! Atari, the tramiels, surely this cant be the same Atari can it) anyway it featured J.T (jack tramiel himself... Fat useless sod!) and the UK head of marketing rob harding (this is made in 1986), look that word marketing is there again, is someone trying to tell me atari actually knew what marketing was, yeh just as much as they knew about supporting those that were using and buying atari's) I also remember that BBC or was it ITV did a drama series on the games software industry, i remember that john cleese was in it, the main character kills of john cleese eventally, there wass a scene in a swimming pool, and the software house specialised in developing games for the Atari ST, the main character in several episodes was seen haunched over the old 520st (the one the 130st was based on), doing programming on it

3919. Console keys software fix

Newsgroup: comp.sys.atari.8bit
Date: 2000-06-24 00:00:00 UTC
From: "Foster L. Putman" <fangmans@bellsouth.net>
Message-ID: <3954E28D.6EB3384A@bellsouth.net>
Source record: 43834

The console keys on my XE130 are fried, and I can't afford a new keyboard right now.
All the 8-bit emulators available define F keys as replacements for the Atari console keys. There are numerous Atari keyboard redefinition programs that allow the user to assign a key to a certain set of keystrokes.
My question... Does anyone know of any software that will accomplish this feat? Or, at best, does anybody know how to go about writing a program to do it?
I could probably cobble something together if I had all the information, but as it stands, I don't know where to start.
Lee Putman

3920. Hooking Up SCSI Disks to Atari 800

Newsgroup: comp.sys.atari.8bit

I have spare equipment from my Power Macintosh that I was wondering would be usable on my Atari 800. The only peripheral I own is a tape drive, so you have an idea of what kind of speed and storage increase I'm interested in.

I was thinking that since the spare equipment are a SCSI hard disk drive and SCSI 4X CD-ROM I would need only 1 piece of equipment to bridge my Atari with the peripherals. Is there such a piece of equipment or do I need to put one together myself?

Thank you all in advance for your replies.

Edison

The MIO and Black Box have SCSI connectivity but are limited to XL/XE usage
thru the Parallel Bus Interface. The ATR8000 is SIO cabled and I have heard
about but never seen a model which had SCSI HD capability. You will probably
put one together yourself.

-Ron

I don't have a solution but I admire the problem.

IIRC the console keys are not read by the standard K: routine and 53279 works differently for Peek() than it does for Poke, but it still might be possible to make some interrupt code as an Autorun.Sys that could look for a normally unused key combination like Shift+Ctrl+S and pass the info on to the OS. You might have to replicate part of the stage 2 verticle blank code in RAM and alter the part that resets CONSOL at $D01F. You would almost certainly NOT be able to do a cassette boot utilizing this patch!

-Ron

I don't have a solution but I admire the problem.

3923. Questions About The XE System

Newsgroup: comp.sys.atari.8bit
Date: 2000-06-24 00:00:00 UTC
From: Sneedy <mketler@goodland.ixks.com>
Message-ID: <39551C78.97108097@goodland.ixks.com>
Source record: 43838

I just recently acquired an Atari Xe System, and it came with a keyboard, lightgun, and controller, but there weren't any docs. I've ran the built-in game(Missle Command), and everything seems to be in working order.

My next question is what to do next with it; I'm interested in buying a disk drive, if possible, as well as some disk games. What drive model should I be looking for? Where would be a good place to start looking? Does a disk drive even work with the XE System(and furthermore, what 8-bit computer is inside the XE?)

Also, what are tape drives? I've heard something about them, but from what I understand, they were much bigger in the Europe then they were here in the states.

I'm also interested in learning basic, so what would I need to get started here? What versions of basic are available?

Thanks to anyone who has the time to answer my questions, it is appreciated. Have a nice day.

-sneedy

3924. bring back atari

Newsgroup: comp.sys.atari.8bit
Date: 2000-06-24 00:00:00 UTC
From: carmel_andrews@my-deja.com
Message-ID: <8j3bl0ell1@nnrp1.deja.com>
Source record: 43839

As far as i understand it Atari had already declared bankruptsy before JTS sold Atari for 5 million USD, so essentially JTS couldn't give a sh*te how much they got for Atari, i guess their philosophy was better get something now for Atari, then nothing for it later on
According to a @friend@ of mine JTS only sold Hasbro the IPR's (intellectual Property rights) to Atari's software archives, namely pacman, digdug, star raiders etc...This has nothing to do with the Atari brandname and logo, and from what I understand it didn't include the hardware (vcs/lynx/st/e/falcon/8bit etc), I know this as my "friend" obtained the remnents of Atari's rights to pacman (for the home)

My idea is for someone to 'obtain' the rights to Atari's h/w patents, and do some deal with wms (who own the remnents of what was Atari's coin up division, the original part of Atari) i say this because, i guess everyone and his wife knows that hasbro have no intention of extending their atari divisions interest in the videogames/ computing ind. outside of software, obviously those socalled experts/pro's at hasbro don't know of Atari's past as a software house, because if they did, hasbro wouldn't have bothered buying Atari's s/w archives... Anyway back to my idea... Do some sort of deal with wms, which essentially gets the atari h/w back into mass production and mass distribution... And essentially do the same thing that IBM did with the PC... namely allow other companies to manufacture Atari (3rd pty) compatables (you can forget, ppc/k7's and p11/111 sh*te) only anything compatable with 65*** or 68*** will do, obviously update the h/w to reflect current tech. standards. i.e removable hard drives/ mass storage dev/ built in cdroms/r-writables, dvd roms etc... and a better version of sio/usb etc (which is one of the same thing anyway) and sell it at the £250/350 barrier... At that price it would be a good seller, forget microsoft (ms) supplying the o/s or dos (we don't want their sh*te in our system) we should go along the lines of what linux is succeeding in acheiving, but without having to adopt linux, allow people to obtain h/w and systems s/w upgates very inexpensively using a similar system to pd/sharewhere, whereas once the user has registered the purchased product (this would be done while he is purchasing his new atari system) all he has to do is send off either the h/w or systems s/w to the manufacturer and for little more then the price of the upgrade/& postage the user will have an up to date system, rather then having to by new s/w or h/w which is unnessesary, this will mean that compaNIES LIKE M/S OR INTEL wont be able to dominate the market like they have, as 3rd party atari s/w and h/w manufacturers, whilst they won't be rolling in it so to speak, they won't have the same problems regarding compatability, bug's etc... after all let's not forget the liitle problem that AMD processors have with windows 95 and 98, now if my idea

was successfull, this wouldn't happen because anyone making s/w or h/w for atari or 3rd pty compat's would have to make sure that his/her product was compatable with all h/w and s/w on atari systems, what would eventually happen is that because Atari the computer firm, has nothing to do with the Atari division owned by hasbro, because Atari systems would becomme popular again, people will want to see Atari's software archive played on Atari's h/w, which means that hasbro would have to seek permission from Atari (comp) to write s/w for Atari and Atari compatable systems, Atari (comp) on the other hand would want an assurance that any thing that hasbro releases on the Atari, isn't then marketed on other competing systems, also that any software rights that was previously owned by the old Atari, would not be allowed to be marketed or sold on other competing systems, and that the name ATARI was not in any way shape or form associated with products marketed for competing systems... essentially keeping the ATARI name unique and not only that but it means that if you buy a product with the name Atari on it, you are assured that the product will only play on Atari systems, and not for m/s sega/sony/nintendo etc...Now before y'all accuse me of being ant m/s or japanese etc... look at it the other way, Say since 1990 when was the last time sega sony/ nintendo or m/s(intel) done anything for Atari.. I cant remember the aforementioned producing anything for atari (h/w or s/w), If they did I must be living on another planet, so in practice, why should Atari produce software or products for competing systems

And with regards to the IPR's that Atari have (the old atari that is), and since according to various commentators in the videogames/computer ind. account's for about 90%plus of everything that has being produced since Atari's inception both h/w and s/w relevant to computer or videogame or interactive entertainment, basically mean that any 'technological developments' that have being instigated for use in h/w and s/w for computer, videogames and interactive entertainment in the last 25-30 years can be traced back to something that Atari themselves, invented, pioneered or created, after all if ampex can still obtain royalites from video tapes (30 years after the things were invente), why didn't Atari start hammering s/w and h/w manufacturers now for those royalties..., because looking at it logically sega, sony, m/s nintendo, activision, eidos, even hasbro, are basic using ATARI Technology or inventions and putting them or marketing them on someone elses system ... Now if you call yourselves Atari users, and that is Atari users in the true sence i.e That you still own the h/w and s/w and are still actively using the system daily... And not one of those sad sod's who use 'emulators', I don't count that as being an Atari user, in the true sence... still getting back to my point... As Atari users(in the trueist sence) would you rather have atari technology (h/w & s/w) used in Atari systems, or would you rather see Atari technology seen in someone elses electronic box

And with regards to customers or market share, the fact is there allready a ready made market for new Atari systems (provided that they instigate backup, support, cohesive/consistant sales and marketing

programmes etc) after all you have those that now have pc's, mac's amiga's etc, and given that if the new Atari's were getting the same support that these 'other' systems enjoy s/w wise with heavyweight programmes and entertainment s/w to compete with msword, lotus note, borland c, tomb raider etc... After all they used to be Atari users, so what's stopping them now...
Then ofcourse you have those that own the "jap crap" i.e sega, sony & nintendo, of to put it another way Atari technology reverse engineereed by the jap's (atari technology in someone elses electronic box), those who as we all know also used to own Atari (though they'd hate to admit it)
Then you have the rest of us (consumers that is) who are wanting to get ahead in videogames or interactive entertainment, who are wanting to buy a quality up to date system, with quality backup, service, support and software, from a supplier that beleives in advancing the technology it was founded on, and supplier that has shown that it can be inovative and not someone selling Atari technology in someone elses box, and not some pale immitation like sega, sony or nintendo... I guess it's about time that users of these competing systems wake up and smell the coffee, and understand that what your buying is atari technology with someone elses name on it, stop being such sad sod's and why not buy atari technology with ATARI's name on it.... That's if you call yourselves Atari users (in the trueist sence)
P S when someone mentioned msdos, why was it that disinfectant or detergents came to mind... no joking ofcourse

Ron's right: the console keys are not tied in with the normal keyboard and
therefore do not produce an interrupt for use by the normal handler. To
make things worse, he's also right about $D01F--there's no way you can
stuff a value into it that can be read by software; actually, writing to
it will result in sound.

Just about the only recourse is a replacement keyboard though I have seen
a "fix" for faulty console keys (a resistor IIRC). The best bet is
probably to look for another XE at a thrift store/garage sale and swap
keyboards (if the replacement is a 65XE or is a 130XE in worse shape than
the one you already have).

I'm not sure, but I think the Supra interface might be usable with an 800.
I believe Bob Klaas owns the rights and could probably provide the answer.

If you do find an interface that will work with the 800, you will still
face a couple of problems in that most 8-bit stuff will only work with
128 or 256 byte sectors and, at least with the MIO and probably the Black
Box, you have to disable parity checking on Mac HDDs (unsure if parity is
used with Power Macs).

A cheaper option might be to run an MS-DOS emulator on the Power Mac so
you can use SIO2PC or APE to access a portion of the Mac's HDD and its CD.

You've got an XEGS (Game System). It's essentially the same as an Atari
65XE computer.

> My next question is what to do next with it; I'm interested in buying a
> disk drive, if possible, as well as some disk games. What drive model
> should I be looking for? Where would be a good place to start looking?

Any drive designed to work with an Atari 8-bit computer will do. Probably
the cheapest and most readily available are the Atari 1050. If you can
find one with an upgrade (US Doubler, Happy, or Archiver) expect to pay
more but it's certainly worth it. You could also use an Atari XF551
(double-sided, double density) but they're less mechanically reliable and
more expensive. It's probably best to avoid the old Atari 810 drives--
they're not quite "bigger than a bread box" but close, and are limited
to single density. Best places to look: thrift shops and garage sales.

> Does a disk drive even work with the XE System(and furthermore, what
> 8-bit computer is inside the XE?)

Yes and, as above, a 65XE (6502 microprocessor, 64KB RAM, 1.79mhz clock).

>
> Also, what are tape drives? I've heard something about them, but from
> what I understand, they were much bigger in the Europe then they were
> here in the states.

Tape drives were a cheap storage device. With the Atari, you need an
Atari tape drive unlike the old TRS-80 which could use any cassette deck.
They were bigger in Europe than North America because computer equipment
was (still is?) far more expensive over there. Believe me, you really
don't want to start fooling around with tape--an unmodified disk drive
uses a 19K2 data transfer rate; the tape drives use 300-600 baud and
are unreliable as well as inconvenient.

>
> I'm also interested in learning basic, so what would I need to get
> started here? What versions of basic are available?

The book "Your Atari Computer" by Lon Poole et al will give you a listing of the Atari BASIC commands along with programming examples. Without buying extra cartridges, the best bet is Turbo BASIC--it's compatible with Atari BASIC but much more powerful, is about three times faster, and complete, on-disk documentation is available.

Whew, I guess it's been too quiet here at comp.sys.atari.8bit.

New hardware? Never happen. Why? A basic fundamental problem. The world lives on graphics and you don't have ANYONE who would be willing to stick their neck out to come up with a new chip set. Pure and simple.

You want a box that will sell, but to do so, you would have to have USB, PCI slots, SIMM/DRAM memory, voodoo2 (at least) graphics, and a IDE hard drive system. Thats what ALL the hardware is compatable with. Why not just buy a PC?

The community is developing (or redeveloping) 1.44Meg disk drive, IDE Hard drives, and browsers for internet communications. Thats about as far as it will go I believe.

Hi Carmel,

I have a bunch of problems/questions with this strategy.

- Your proposing that the system be 'Open architecture'. What's to stop some company implementing a not quite Atari compatible Atari... Much like the early days of PC-clones... The market place pressure? / Atari would check it, If it isn't up to muster it gets rejected ? What if it is better than the architecture that Atari offers... Maybe they would reject that too because it offers competition...

<carmel_andrews@my-deja.com> wrote in message news:8j3bl0ell1@nnrp1.deja.com...

> ppc/k7's and p11/111 sh*te) only anything compatable with 65*** or 68***
> will do, obviously update the h/w to reflect current tech. standards.

I think using a 65*** or 68*** is a bad idea, it's just too old. I would suggest a modern decent embedded cpu. They now have embedded RISC/VLIW that run at over 1 BIP. If you wanted to offer backwards compatibility, install a 68K/6502 emulator in rom, (copied to RAM for fast execution) and use that. A few years ago I would have suggested StrongARM, not any more.

<new hardware snipped... it's good stuff>

> (which is one of the same thing anyway) and sell it at the ?250/350
> barrier... At that price it would be a good seller, forget microsoft

OK thats about, what $500 bucks U.S. ?

If you look at the playstation-2 hardware you get an idea of what sort of stuff that much dough should buy you. I would love a playstation-2 that had expansion possibilities, a decent keyboard, compilers, OS's/the works... In other words a new home computer...

< lots of software strategy snipped>

> postage the user will have an up to date system, rather then having to
> by new s/w or h/w which is unnessesary, this will mean that compaNIES

> compatability, bug's etc... after all let's not forget the liitle

This is cool, but for OS stuff why not supply the OS on media, and registered owners get sent a new CD/ Whatever every now and then... If you wanted to make the system really proprietry, you could store a unique ID on the motherboard of each machine, encrypt the software to the motherboard and then let the machine download it. Only problem is privacy advocates and normal people feeling 'trapped' to your OS...(Significant I reckon)...

> problem that AMD processors have with windows 95 and 98, now if my idea

> only that but it means that if you buy a product with the name Atari on
> it, you are assured that the product will only play on Atari systems,
> and not for m/s sega/sony/nintendo etc...

This means that your new Atari would force hardware/software vendors to submit designs for verification. How much would this cost/how long would it take ? Thats exactly what current companies do and IMHO it sucks. Sure it keeps the junk from
surfacing, but it also causes small developers heaps of grief. Compare the diversity of games available for the PC to the console machines. Occasionally if your lucky they port a PC game to a console...

Imagine that your new Atari becomes succesful with the policies you suggested, It sure sounds like a monopolistic practise to me, forcing

vendors to not port software to another architecture and offer it...
Presumably there would be some kind of repercussions if they did... The
Atari laywers would sue them if they released 'FOO' for the Playstation-2
after it was released on the Atari. Boy, I bet the Justice department would
get interested...

>Now before y'all accuse me of

Man your opening a real can of worms here. Companys already sue for
intellectual property issues... Can you imagine what would have happened if
Apple had managed to win it's suit against MS ? I am not a MS supporter,
but the idea that Apple could have rights to all 'GUI's... Apple lost, but
imagine if XEROX did that... Or perhaps ...Hmm cant remember the guys name
who developed the GUI... It would just be terrible...

> electronic box

I like Atari 8 bit systems because they offered an amazing synergy of
hardware and software technology at the time they came out. (Not the ST,
the Amiga was much more philosophically like an 8 bit than the ST). You
could see that synergy realized any time you fired up star-raiders... The
software used the hardware, and it came to life.

<snip, I agree on the market share point>

> Then ofcourse you have those that own the "jap crap" i.e sega, sony &
> nintendo, of to put it another way Atari technology reverse engineereed

> it)

Come on mate! Don't hassle Nintendo, If you read the history you will
discover that Atari's management managed to shoot
itself in the foot repeatedly... Atari's management was it's own worst
enemy. If they had released the 1400/1450 XL,
Got the rights to Amiga, and actually kept innovating they would still be
here. They even messed up the release of the Jaguar and Lynx. Consider
Nintendo in particular, Didn't they actually SHOW Atari the NES... Oh yeah
and they had the 7800 but
didn't release it right away... Pitiful... The 5200 joysticks sucked,
engineering pleaded with them not to use the bad sticks, but hey they lost
that decision. The 5200 could have been 400 compatible (easily) but they
made it just a bit different... (Insanity ???, why not just take a 400, chop
off the keyboard and sell that...) It would have been about the same
size/wouldn't it ? The ST's, surely they could have done better...

> Then you have the rest of us (consumers that is) who are wanting to get

>
>
> Sent via Deja.com http://www.deja.com/
> Before you buy.

Don't get me wrong, I like your idea, but think you need to ponder a bit
more... Reguarding your last bit, I would venture that if you build it they
will buy it... If it's good then they will buy more... The atari name
still has sizeable goodwill. I am firmly
of the opinion that if somebody implemented a modern system, with the same
focus as the team that designed the 400/800, they would have a winner on
there hands. Computers are commonplace nowdays, it's very different from
the early 80's...
If somebody came out with a brand new system, un-encumbered with the
problems of old hardware, at a price point of $500
for the base machine with say 64 MB RAM, 10 GB Disk, A decent processor and
AV subsystems, and with the Atari name

and some real backing behind it, people would buy it. People would buy it
in droves, Older people who remember Atari when it was #1, and the strange
new generation (Y?) who seem to think atari is cool in a retro kind of way.
Oh yeah and if
it could play DVD's and games were as simple to play as hitting 'eject' on
the dvd player, loading the game, and hey-presto.
Imagine a playstation-2 made into a 'real' computer... With an awesome Atari
logo on it...

Cheers
Peter

p.s. To lawyers... Atari and Hasbro and owned by whoever owns them
nowdays... Hasbro/ JTS / ???

coughs

Tiger released the Apple][based Learning Computer, apparently, last
year. Why base it on the in some ways superior, but as a childs toy,
vastly inferior, Apple?

Surely a $99, cartridge, SIO and PBI compatible 'learning computer'
would be a better way to go.

Problem is, who is going to make ANTIC, GTIA and Pokey?

The Apple][didn't use custom chips.

Even the //e was fairly simple, although they were custom.

Finally, //e-extended production, with a 4-chip board, only stopped
recently, and the new chips were surface mount, therefore compatible
with modern technologies.

I'd like to see a 520XE-M, or even better, 520XEFM, but it won't
happen...

What is this BlackBox that people keep talking about, anyway?

Wasn't Kate & Allie Canadian? Not that it really matters...

>BBC 2's open university program on 2 occasions had a program about the
>computer industry, it featured a firm selling OPD (one per desk) by ICL

The OPD was by Sinclair Research -- it was a Sinclair QL desktop
system. Didn't really take off, but had a nice multitasking OS.

>i think, and also Atari (when they were owned by the tramiels) and it
>was basically wittling on about strategy, marketing etc (what!
>STRATEGY! MARKETING! Atari, the tramiels, surely this cant be the same
>Atari can it) anyway it featured J.T (jack tramiel himself... Fat
>useless sod!) and the UK head of marketing rob harding (this is made in
>1986), look that word marketing is there again, is someone trying to
>tell me atari actually knew what marketing was, yeh just as much as
>they knew about supporting those that were using and buying atari's)

Jack wasn't so bad; it was his sons, Gary, Leonard and Sam that were
the useless sods. They're the ones that drove Atari into the dirt
when Jack retired.

>I also remember that BBC or was it ITV did a drama series on the games
>software industry, i remember that john cleese was in it, the main
>character kills of john cleese eventally, there wass a scene in a
>swimming pool, and the software house specialised in developing games
>for the Atari ST, the main character in several episodes was seen
>haunched over the old 520st (the one the 130st was based on), doing
>programming on it

I don't think the 130ST was ever released -- at least not in great
quantities. They also did a 260ST which I think also wasn't released.

>I just recently acquired an Atari Xe System, and it came with a
>keyboard, lightgun, and controller, but there weren't any docs. I've
>ran the built-in game(Missle Command), and everything seems to be in
>working order.
>
>My next question is what to do next with it; I'm interested in buying a
>disk drive, if possible, as well as some disk games. What drive model
>should I be looking for?

The 1050 is the most common. It's a single-sided, enhanced density
drive (130k), which you can also get US Doublers for to give it true
double-density (180k) and ultra speed sector skew. Another popular
one is the XF551 -- a double-sided, double-density drive (360k).

> Where would be a good place to start looking?

Here... or EBay.

>Does a disk drive even work with the XE System(and furthermore, what
>8-bit computer is inside the XE?)

Yes. The XEGS (XE Game System) is basically a remodeled 65XE. To
that end it has all the connections, it's just missing the expansion
bus (meaning you can't hook an MIO or blackbox up to it)

>Also, what are tape drives? I've heard something about them, but from
>what I understand, they were much bigger in the Europe then they were
>here in the states.

Tape drives used regular audio casettes to store program data.
They're rediculously slow, and reliability largely depended on the
casette media you used. Typically low-storage tapes (10-20 minute
ones) were more reliable due to the extra thickness of the mylar.
Larger tapes (regular audio 60-90 minute) were less reliable because
the mylar was thinner, and was more condusive to bit rot.

>
>I'm also interested in learning basic, so what would I need to get
>started here? What versions of basic are available?

The XEGS has Basic Rev. C I believe, which is considered all-round
reliable. There are a number of sources for learning bits of Atari
basic, but I can't recall any offhand.

This is actually called 'We need something to talk about, sooooo, I might as well come up with something'. I am looking at possibilities for machines, not impossibilities....otherwise we would already be talking 1Ghz Intel monsters....

>
> Why a 65C816? Why 14Mhz?

65C816 since it is compatable with the 6502 code wise. 14Mhz is I think the top speed of it (or is it 20?)

>
> Why 128K EEPROM for the OS? What is it that requires 128K? What memory
> mapping would be used?

128K Flash since 512K and up are scarce and on allocation. What requires 128K is the OS (single tasking), DOS, and drivers for peripherals (probably using 30K total). The funny thing is that rewriting the current OS to work in 65C816 native mode may make it smaller.

>
> What is a "16 bit" sound processor? POKEY currently runs using 16 bits of

If you want to drive POKEY go ahead, I was looking at soundblaster or so.
>

Actually, in the real world you would be right. BUT, here in Atariville, the reality is this:

If I designed a new computer based on the above, I would need an OS that no one has time to write, a DOS that no one wants to write, and drivers for USB peripherals that I would get stares if I mentioned it.

Hell, no one has written a DOS that breaks the 16 MB hard drive partition barrier yet. (as far as I know), so starting on a whole new project is a bit much.

Tony

3942. XEGS variations?

>If you want to drive POKEY go ahead, I was looking at soundblaster or so.

Boring *laughs*

Part of the beauty of the Atari is the way it sounds and the fact that people have to program it to sound that way, instead of sampling.

Dual Pokey chips, to provide stereo, or the XE-M chip, would be much nicer. I'd guess that the XE-M had been designed whilst the Apple IIgs was around, which is widely regarded as the machine to beat where sound origination is concerned (before getting into FM-synth and sampling on PCs).

Why not make a PC-clone, in a small case, which runs an emulator from DOS all contained in flash ROM?

You could just put in on a chassis that fits inside a clone case, plug
in a 6502 running at 500 mhz, add a modern graphics card. Then we
could get Lance at Video 61 to run off a bunch of BASIC carts with new
gfx modes.

GR. 5 + 32 = 640 x 480 x 256 colors.
GR. 6 + 32 = 800 x 600 x 4096 colors.
GR. 7 + 32 = 1280 800 x unlimited colors.

Carmel I love your idea and would buy most anything new that is related to Atari, but I just do not see it happening. Hasbro only wanted to get Atari so that it could profit on all the patents and this does not include the computer aside. If they were smart they would see that part to someone who would want to start it up again. Who??? I am not sure.... Also, I think Hasbro should take over the Lynx and start producing it again. It would be stiff competition for the Game Boy color.

A modern Atari 8bit may very well be better than a PC or Mac but I doubt
anyone would buy one. There's no market for consumer general purpose 8
bit computers these days. A shame.

I bought my Atari 800 in 1979 and a XE130 in 1988 or '89. Sitting on my computer desk is a Pentium III PC. I made a living with PCs since 1984. Why did I keep my 8-bit Atari - I don't know. Why am I messing around with an 'old' 8-bit computer - I don't know. Maybe it's just something for an old, retired man to do.

The sorry management history of Atari was and is a crime, it's a wonder that it lasted as long as it did. It happened and you can't change it.

Could Atari come back, be reborn? My answer to that is, WHY?

Why would anyone buy an 8-bit computer that has no software, or hardware for that matter, that can't compare with anything the modern PC will provide. Two or three good examples:

Huge software applications/games that need fast (1ghtz cpu ?) computers
and
lots of storage (40 gig hard drv?) space, and lots of ram (512 meg?).

Fly SubLogics Flight Simulator on the Atari, and then fly MS Flight Sim
2000 on
the PC.

Listen to that favorite music CD, or watch that DVD movie on your Atari.

Let's face it, way back when...doing most anything on a computer was hard work. That work could be done on an Atari system as easy and as good as anything else that was on the market at the time. This is not the case now.

So, I ask again, why do people (including me) continue to "play" with the Atari? To see what they can make it do. To see how far they can push the machine (like taking an XE130 and pumping it's RAM up to 1 meg when there was really nothing developed to use all of the 128k the computer came with).

Human nature is not to throw a perfectly good operating computer away. That and nostalgia is why people still have, buy, use, and collect their Ataris. Just like people who loved their commodores, or cocos, and on, and on...

Well that would cheating then, wouldn't it? And besides, there is no
emulator in existence that is utterly, utterly 100% spot-on perfect as
far as emulating the 8-bit goes. Atari800Win/DOS and XL-It! are very
close, but there are still issues, and you'd still be paying a bit for
an emulated 8-bit in a case like that. Consider that you'd need a
Pentium-class processor to run at full 8-bit speed, a good Vesa 2
compliant video card to get a proper video mode in full screen with
the correct aspect ratio and full overscanning abilities, and you'd
have to steal the CTH-modified routines from A800Win and port them to
the DOS version in order to get proper R: handling ability that can
actually talk to a real modem or network connection in the PC.

Then, of course, there's no hope for real cartriges... and as far as I
know only the CTH-modified A800Win can run OSS cart ROMs properly.
(Well, it runs Mac/65, anyway...)

<rest snipped>

Ok to answer this, lets be practical. When Atari released the 400/800 they were technically competitive with other offerings, many might say they were ahead of the competition. For anyone to seriously consider a new 'Atari' or micro for that matter then they have to address the issues you have.

- Making a machine based on an 8 bit will attract some people (The sort reading this newsgroup) but the vast majority won't
even consider it.
- What price would you sell the machine for ? What's your target audience ?

That said, I think there are two ideas going on here, the 'Lets build a new 8 bit with resources possible for the Atari community... the 65816 type machines' and, could some company (with sufficient resources) design a new machine that has the attractiveness of the Atari 8 bit, modernized...

Taking an arbitrary price point of about $500 US, A decent modern micro (non pc-compatible) base unit only (No monitor,
no harddrive (it would need one)... But with DVD and RAM should get you to a playstation-2 level.
Imagine a machine like a playstation-2. With that level of graphics and audio, but with a decent harddrive, USB, IDE, 100 base-t ethernet, that's the sort of machine I am thinking of.

If a company did this, didn't make the machine obviously braindamaged, and sold it, I think it would sell. If it was a new 'Hasbro/Atari box' then that would be fine. They could still make the games, and have the machine boot from DVD. It would be a box that you could throw a game DVD into and play, or put a movie DVD into and watch. You could surf the net with it. The only thing that the Playstation-2 won't do from what I can see is offer capabilities as a general purpose machine...
You would have to sell your system for more than the Playstation-2, because you couldn't guarantee you would make money
on software (Which home console makers lock you into)...

If somebody offered a box like a PS-2 with a keyboard and programmability/expansion, I sure would take a long look at it.
Would you ?

Cheers,
Peter

Foster L. Putman wrote:
>
> Could Atari come back, be reborn? My answer to that is, WHY?
>

My answer to that has two parts. The first thing is simply that it would be an alternative to Windoze, PCs, and Macs. More importantly I would like a new computer standard for hardware reasons.

In terms of usability I prefer PCs, I have lots of PCs and no Macs. This is because I like MS-DOS as an interface and I use a lot of DOS programs. Right now I am running a Cx686MX-225mhz with MS-DOS 6.0 and Windows for Workgroups 3.11. Almost all new software that comes out is for Windoze 9x or something else but not DOS (except for things like emulators which I use a lot). I consider Win 9x to be a very poor OS so I don't use it on most of my computers. I have had all sorts of problems with Win 9x and it's software, DOS never has those problems (like corrupting itself so that I have to reinstall it), in fact Win3.11 has never demolished itself either. Win 9x is also more demanding of disk space, RAM, and processor power.

So, I tolerate PCs but I don't really like them. With all this bad software about, I being a programmer am compelled to try and do a better job myself. Of course PC hardware was stupid to begin with and standards are scarce. Even things that once were fairly standard, like OPL2/adlib cards and modems, are being replaced now by Sound Blaster cards that emulate the OPL2 (poorly) and these horrid things called WinModems. Also, the only programming languages that I like to use are BASIC and assembler while most other PC programmers think C is the only thing worth using. I have all sorts of trouble finding the right documentation to take advantage of PC components from assembler. Much of the documentation that I find leads me to think that PC hardware is so stupidly complicated that I don't even want to mess with it. On the Atari 8-bit you read ONE memory location and examine the bits to make use of the joystick, and another spot for the trigger. On PCs you have to write to some location, then, using the PC's timer, you see how long it takes certain bits to change and that is how you read the position of the joystick. Seems to me like an excessive pain in the butt (and it certainly isn't the only thing).

So I want a new computer to program (I like 6502s and 65816s, but anything would probably be better than an x86). I also want a new computer so that some actual hardware standards can help companies to make software of better quality. It isn't nice to have to download 3.6mb modem drivers or have your computer lockup every other time you use it.

Even if there were a new Atari that had a 65816 at 14mhz and other specs that were comparable not to a 500mhz PC but were comparable to an early 90s machine I would like that. It wouldn't be a total solution but I could program for it and use it to browse the web and things. Right now all the programming I do involves 8-bit machines. I am working on some games for the Atari, NES, and Turbo Grafx which all use 6502 variants.

The gossip I heard was that "Behind Jaggi Lines" was pirated before the game got to market. The official release was "Rescue on Fractalus." Hence the difference in names.

The fundamental problem with this is that the video game console
market is saturated as it is -- and it doesn't take much. You only
need two or three competing systems on the market to reach saturation
level; anything above and beyond that had better have something pretty
damn revolutionary if they want to even hope to compete. Bringing out
a comparable system isn't good enough, even if it's placed at a price
point below existing consoles. It has to *clearly* and *visibly* give
the general consumer something -- or a number of somethings -- the
other systems don't, can't, and upon being faced with this new
offering, desperately need to. But it ain't gonna happen. Microsoft
won't get *anywhere* with the X-Box, not with the Dreamcast, PSX2 and
Dolphin to contend with.

>If somebody offered a box like a PS-2 with a keyboard and
>programmability/expansion, I sure would take a long look at it.
>Would you ?

History has shown repeatedly that console attachments that try and
turn the machine into a full-fledged computer tend to flop, and
although modern 'net access makes a keyboard attachment a somewhat
more attractive proposition, even the N64's funky blue keyboard
attachment with cartrige-based 56k modem and net access software

hasn't earned its keep.

I know. I'm being cynical, but also realistic. I like the 8-bit the way it was. It was a classic system, advanced for its time with features other machines didn't have. I *still* like it, and it's my favourite machine to emulate -- that and the 2600. Personally, I wouldn't change a thing...

...okay. DiamondGOS could have actually taken off, Philip Price would have finished the AR series, and the Sons of Tramiel would have taken jobs at McDonald's instead of inheriting Atari, but that's *it!* :-)

I agree that bringing out another console isn't going to work. I haven't
seen the specs of the X-Box in detail, but the psx2
looks to have the lead (Sega is toast, and nintendo's dolphin better be
pretty amazing to even have a shot).
The point here is that they were designed as consoles, not as a general
purpose computer with decent integrated subsystems.

Yep, your completely right here (About consoles modified with keyboards), but if it was possible to create micro's in the late 70's/80's that could give a console system a run for its money and provide a general purpose programmable computer, why shouldn't that be possible now ? The Atari 400/800's were actually more advanced than the consoles they competed with in terms of games. The C64 was pretty good too. The Amiga also qualifies, it was an excellent game machine as well as
computer.

OK, but what if somebody built a new machine along the same principles of an Atari 8 bit (great graphics,sound and IO/expandability) , moderinized with hardware, wouldn't you like to use that than a PC? Not a 65** based box, something
based on a decent modern ISA.

Yeah and lucasfilm could have kept releasing games for the 8 bit... The 4 they did were pretty awesome, I wish they had kept at it.

Rob was resonsible for the curcciculum ST packs ISTR which sold a shedload
of units.

> just as much as they knew about supporting those that were using and
> buying atari's)
They had a very limited budget and were hand-tied by Atari US in a lot of
cases. To be fair, they did listen sometimes. I suggested they should sell
the dev kits (ST) to Joe Public rather than developers. We had a few
emails/chats about it (via Alistair Bodin) and lo and behold hey released
the full ST dev docs.

Nope. They have at least some hardware and def. the name too. They
released the Jaguar cart encryption keys to PD so they obviously have
control over that.

> of software, obviously those socalled experts/pro's at hasbro don't know
> of Atari's past as a software house, because if they did, hasbro

Hasbro are doing an awful lot of good stuff with the Atari name an
intellectual rights. Far better than anyone had a right to hope for to be
honest.

> h/w back into mass production and mass distribution... And essentially
Why? As a way to lose money? What is the point. There is nothing left of
whatever people here think of by the name 'Atari'. It's history. Atari is
a state of mind from your youth. The staff have gone, the hardware is
useless for 99% of modern users. You might sell the odd bit of kit to an
Atari nutter but you'd be insane to try such a thing unless you had
a bottomless pit of money to waste.

> do the same thing that IBM did with the PC... namely allow other
> companies to manufacture Atari (3rd pty) compatables (you can forget,
> ppc/k7's and p11/111 sh*te)
Ermm, what makes them shit? They are considerably more potent than a 6502.
Shit because you like getting an Intel? Shit because you all hate bad old
Bill (boo hiss). Explain?

> only anything compatable with 65*** or 68***
But Atari released some PCs so can we use 80286s too? What about the CPUs
in the consoles? What is the point of getting keyed in to some ancient
underpowered CPU just because it was useful 20 years ago and the ATari
name gets you all excited?

> (which is one of the same thing anyway) and sell it at the £250/350
> barrier... At that price it would be a good seller
At that price it would bomb. Forget it. Dreamland.

> we should go along the lines of what linux is succeeding in acheiving,
Semi sensible. Embedded Linux would be a good starting point but would you burn it in ROM or have it a full version on HD? If the latter, how many home users would want to get to grips with a Unix-alike when they can have nice friendly Windows instead?

> but without having to adopt linux, allow people to obtain h/w and
> systems s/w upgates very inexpensively
You really know zero about the economics of running a company don't you. Do you have any idea what it would cost to ship in, refurbish, check, guarantee, ship out stuff?

> 3rd party atari s/w and h/w manufacturers, whilst they won't be rolling
> in it so to speak, they won't have the same problems regarding
> compatability, bug's etc...
And on this complex new hardware, all these 3rd parties are going to write 100% bug free code? The reason Atari/CBM/whatever machines used to be so solid was because they are so simple. Make the machines more up to date and they are going to get buggy. Complexity brings errors unless you are working with a massive budget in which case the product will cost more than people are willing to pay.

> problem that AMD processors have with windows 95 and 98,
One easily fixed prob with win95 and none with win98.

> was successfull, this wouldn't happen because anyone making s/w or h/w
> for atari or 3rd pty compat's would have to make sure that his/her
> product was compatable with all h/w and s/w on atari systems,
Ermm, it's supposed to be like that on WIndows. That's why MS have a certification system for drivers, hardware, apps etc. This is impossible to achieve. No tinpot developer wil be willing to ensure anything they do matches a whole bunch of other peoples efforts, just in case.

> to do with the Atari division owned by hasbro, because Atari systems
> would becomme popular again,
Why? Most people these days don't know who Atari are or think they went under around 1983. To most game buying kids and young adults the name means nothing.

> being ant m/s or japanese etc... look at it the other way, Say since
> 1990 when was the last time sega sony/ nintendo or m/s(intel) done
> anything for Atari..
Why should they? What an idiotic statement. If there was a ten million Atari systems they would which leads on to..

> anything for atari (h/w or s/w), If they did I must be living on another
> planet, so in practice, why should Atari produce software or products
> for competing systems
Atari did it because their own systems weren't selling enough and revenues were falling.

They did. They got money out of Sega and Nintendo. A lot of money. Didn't
stop them going belly up though.

> ... Now if you call yourselves Atari users, and that is Atari users in
> the true sence i.e That you still own the h/w and s/w and are still
> actively using the system daily...
I still get all gooey eyed at the site of an Atari 800/810 combo and I
have a 130XE and 800XL in my computer room but I know they're only good
for playing some old games that I'm nostalgic about. Anyone that says
otherwise is just deluding themselves. Modern machines can do everything
an Atari could and far better/faster. Cheaper too probably. I paid £1200
for a Mega STe. My last PC was built for around £400 and is a hell of a
lot better.

> And not one of those sad sod's who use 'emulators',
Or realistic people...

> sence... still getting back to my point... As Atari users(in the trueist
> sence)
where trueist == your view.

> would you rather have atari technology (h/w & s/w) used in Atari
> systems, or would you rather see Atari technology seen in someone elses
> electronic box
If there had been a continuity with better systems coming out over the
years and Atari being the same company with the same staff we knew and
loved (with exceptions..) then I'd probably agree. The reality is that
that has all gone. Atari is just a bunch of patents/rights and some fond
memories that seem to delude certain people that muttering 'Atari' will
make it all go well in the world.

> And with regards to customers or market share, the fact is there
> allready a ready made market for new Atari systems (provided that they
> instigate backup, support, cohesive/consistant sales and marketing
> programmes etc)
Proof? Don't say 'fact is' otherwise. Opinion, not fact.

> borland c, tomb raider etc... After all they used to be Atari users, so
> what's stopping them now...
Maybe they have moved forward with their lives...

> Then ofcourse you have those that own the "jap crap" i.e sega, sony &
> nintendo,
Why crap? the fact that Sony sell as much as they do means they have got
it right. Like it or lump it. That said, the PS2 had stiffed in Japan and
is being hammered by the Dreamcast whereas the DC has failed in the US &
Europe to meet targets.

> who as we all know also used to own Atari (though they'd hate to admit
> it)
Huh?

> Then you have the rest of us (consumers that is) who are wanting to get
> ahead in videogames or interactive entertainment, who are wanting to buy
> a quality up to date system,
What like whatever Project X turned in to? i.e. get a bunch of ex-Atari
hardware engineers, Jeff Minter and a shedload of venture capital.
Develop a chipset, wow the press then put it all in a DVD player sold in
Japan and wonder why you have dissapeared from view? What a shambles..
Ooh, Tempest 3K. That will save 'em. Not.

> understand that what your buying is atari technology with someone elses
> name on it,
Who gives a f*ck? Do you care that every time you get in a car you are
using Mr Benz's technology? Nope. Do you care that when you buy a TV it is
a Baird device? Nope.

Sorry but if you really believe what you write you need a dose of reality
and badly.

Picking at facts here. Each channel has an 8bit frequency , 4bit
volume, 3bit distortion and a volume only bit. getting 16 bits from
that for a sound processor is a bit much. pokey can combine 2 channels
to make true 16bit sound.

I'm trying to flowchart and storyboard a 'Return to Jaggi' game, to send
to Lucas' current games division (Lucasarts?). Obviously, for PSX/2 and
PC, not the 8-bit!

Who knows. If they like the idea, perhaps they will give me a free copy
(and if it's for PSX2, the machine to play it on *laughs*).

There are some elements which are critical to gameplay - however, I
think my plans are looking good. Wish I could program!

Richard

From what I remember, hackers stole both Behind Jaggi Lines and
Ballblaster via phone lines when they were still work-in-progress
titles. This probably added to the delay of the releases.

From: Mindfield <diespamdie!!!mindfield@home.com>
Message-ID: <gj5flssqiultktejahf2g4touvr78n2pum@4ax.com>
Source record: 43781

On Mon, 26 Jun 2000 04:04:16 GMT, "Peter Laing"
<snailboy1REMOVECAPSTOREPLY@earthlink.net> drooled an embarassing wet
spot in his lap as he typed:

>I agree that bringing out another console isn't going to work. I haven't
>seen the specs of the X-Box in detail, but the psx2
>looks to have the lead (Sega is toast, and nintendo's dolphin better be
>pretty amazing to even have a shot).

I dunno, Sega's doing fairly well with the Dreamcast. They missed the
boat last time with that 32x band-aid and the ill-fated Saturn, and
when Sony upstaged absolutely everyone, Sega practically faded away
into oblivion. The Dreamcast however has one important thing over the
competition: They hit the next-gen early adopters before anyone else
did, and they have a pretty significant lead. Trip Hawkins tried that
with the 3DO. He even made a Gates-esque quote by saying, "If you want
to beat the competition, you have to place the stake so far out there
that no one will challenge it." Almost immediately, Atari stole his
thunder and released the Jag. Unfortunately they didn't have the
resources to market it properly, and although Sega flopped, they still
managed to steal some of the market. Then Sony and Nintendo stole the
rest. Sega on the other hand has the technology, the resources, and
the wearwithall to keep the DC a strong and solid contender in the new
next-gen wars. Sony's Playstation2 will be pretty strong competition
to because of its existing reputation. The Dolphin, too, also because
of a solid, loyal following of devoted Nintendo fans.

The X-Box... well, that's a whole 'nother ball of wax, that is. And
it'll flop. It's competing with huge guns, using technology that's
barely comparable to what already exists -- and it runs a modified
Win2K fer cryin' out loud. It's basically a PC in a box. History had
shown here, too, that the reverse of the console-to-computer concept
also follows vey closely. Commodore and Atari both tried it.
Atari's hovered on the border of near-failure. Commodore's never made
it past prototype.

>The point here is that they were designed as consoles, not as a general
>purpose computer with decent integrated subsystems.
>
>Yep, your completely right here (About consoles modified with keyboards),
>but if it was possible to create micro's in the late 70's/80's that could

>400/800's were actually more advanced than the consoles they competed with
>in terms of games. The C64 was pretty good too. The Amiga also qualifies,

>it was an excellent game machine as well as
>computer.

Because functionally similar as they might be, they appeal to two completely different demographics. We're also talking about two completely different eras, here. In the 70s and 80s, home computing technology was just as new as new as home gaming technology, and everything was fresh and new and original. In those early days, you couldn't say that Game X was like Pac Man because Game X *was* Pac Man; at its initial release, there _were_ no games like it. Today, originality is almost impossible to come buy, and coupled with current game company philosophies, the general public is utterly jaded. We've seen it all, we've done it all, and no one's making much of an attempt to show us something really new and innovative. All it is these days is improvements or alterations on past concepts and technology. So what is there to attract an audience? Retrogamers like the lot of us here would sure love seeing a repackaged or remodeled 8-bit, but in the end, that's the only market something like that will ever reach. It's not by any means anyone's 'starter system' 'cos _that_ particular bar has been raised *far* above the level of even the 16-bit machines. The average starter system these days is a Celery--er, Celeron 350 or so.

Plus, these days, high-end PCs and current game consoles are pretty closely matched when it comes to games, with PCs generally outdoing consoles only in terms of resolution (a limitation of television broadcast signals more than anything). And like I said before, if it can't offer something dramatically superior to what's already out there, no one has any incentive to buy into it.

There's no room! Anyway, my house is soon to be dominated by Atari - XE
VGS in the bedroom, XE VGS or my existing 65XE in the living room, 800XL
system in... damn, I'm running out of places.

I had been going to put it in the office where the 128D lives - but the
128D is neat, tidy, all in one and has an 80 col display making it
actually useful for charting ad bookings quickly!

If I ever got a printer for it, the Jaguar would have to move ;)

As it is, I still don't have the keyboard, so it's useless, but the
monitor is good for playing Tempest 2000 on when I'm bored...

Richard, saw some cheap-ish Toilet seat adaptors on eBay and plans on
getting one soon.

On the matter of adding a keyboard to a console:

As we all know, the XEGS sold fair to middlin' as game console. Somebody I knew at that time tried to get people who purchased it to shell out for a disk drive and make it into a computer. He actually stood outside a Toys R Us, waited until somebody walked out with the XEGS, and handed them a flyer. It urged them to buy the drive. It also urged them to tell Atari what they had done and to ask Atari if they display the disk drive/real computer option prominently in their advertising and on the package.

AFAIK, the litter basket down the street contained many of those flyers by the end of the day, and nothing else came if it.

I think Foster L. Putnam had the right idea. If I didn't have other requirements for my time and room pulling at me, I'd still have the Atari system set up next to, and connected to, my PC, to do what it does best.

How much of this was crappy marketing/ very late to market. Let's face it,
Atari could have made the 5200 400/800 compatible, offered a keyboard and
they would have had much the same thing. Sure the XEGM was a 64K box, but
it was too late. Does anybody know how much a 5200 cost vs a 400/ the
competitive atari 16K RAM 8 bit at the time as
5200 introduction?

That said, I respect everyone's views, and I always felt the same way
(Keyboards+Consoles are dead ends). It's just that after looking at some
PSX-2 figures, I tried to objectively re-evaluate this option. It all
started a few months ago when somebody posted on the povray benchmark site
the results for a PSX-2 development board. It blew everything else out of
the water. I then started wondering what it would be like to have one of
those development setups (They run Linux too!)...

I guess what this really comes down to is a survey, do game players want
computers too... If the answer is 'not sure', 'possibly' or 'I might' then
that just isn't good enough. I am the kind of guy who would say 'Hell yeah,
and where is the documentation on the custom chip registers...You say it has
microcode ? Can I reprogram that too?'

Been lurking in the QNX newsgroup lately and there does seem like a nitch market is out there, just not an obvious one. The mass market C64/Atari 800 days do seem to have passed.

I should go back to the web site and get some hard figures, but there have been something like 800,000 downloads of the QNX single boot floppy web browser to Russia and 200,000 to Japan. I am pretty sure the demo will boot on something as a lowly as 386 with 3
megs of RAM and no hard drive.

Most of the discussion in the newsgroup is about SBC, Ampro, that kind of stuff, and embedded controllers.

It is all over for the ~$1,000 Atari 800 with an 810 drive, but it does look like there would be a *very* thin market for something that was almost designed like the original Macs or maybe the old Timex 1000, but could satisfy current performance requirements.

I think the rest of the world is kind of getting on the bandwagon, just that they don't have as much money as there is in North America or Western Europe. It won't be an Atari type computer, but I could see some highly technical former Eastern Block county like Poland or Russia coming out Model T type computer design.

3977. ISO2PC cable problems

Newsgroup: comp.sys.atari.8bit
Date: 2000-06-26 00:00:00 UTC
From: "Foster L. Putman" <fangmans@bellsouth.net>
Message-ID: <39580A91.74F91DB9@bellsouth.net>
Source record: 43794

Okay! I went out and got myself a one chip (not a 1489, but
14C...something) cable.
So far, I haven't had to much luck with it. I have been unable to get
anything to work with the ISO2PC software (ver1.19).
I have been able to access the PC from my Atari using APE 95/98. The
only problem is that I can not get my Percom DD drive to work.
What I ended up doing was to unplug the ISO2PC cable from the Percom,
boot the Atari with MyDos4.0 which sets up a ram disk (D8:). Then I plug
the ISO2PC cable into the Percom. I lose the Percom but still have D8:
available to copy files from the PC onto. I then unplug the ISO2PC cable
from the Percom and copy the file(s) from D8: to a disk. Involved, what?

I haven't done to much on the PC side yet. I tried to set up a PC
ramdisk from the Atari, but didn't have much luck. I think a lot of my
problems would go away if I could figure out how to get my Percom to
work with the ISO2PC cable plugged into it (in case you're wondering,
Ape drive bay 1 is empty).
Does anyone have any ideas?

Can you get us some voltages or is everything buttoned up? Do you get any
noises coming out of the Atari with the setup?

The only time I have had trouble is when I was using SIO connectors and
drives that hadn't been used for 4-5 years. They made lousy contact and the
farther away from the computer on the chain, the worse the respose was.
Drive one almost booted, drive 2 would squawk, SIO2PC would ignore
everything.

You are using the RI version of the cable and have the software set up for
that in both SIO2PC and APE, and are not using a 1200XL?

>
>AFAIK, the litter basket down the street contained many of those flyers by
>the end of the day, and nothing else came if it.

Not entirely surprising. Gamers want game machines. Dedicated
consoles. And as much as the XEGS was nothing more than a remodeled
65XE computer, it was marketed and sold as a dedicated game machine,
and gamers bought it, despite it being a fully functional computer,
and used it for -- yep -- games. There are of course plenty who used
it as a computer, but there are lots of borderliners out there who
love games and general computing both. But the majority of consumers
sit firmly in one or the other camp; gamers buy game consoles, and
everyone else buys computers. Gamers don't want computers, and
non-gamers (or people who want a real computer) don't generally buy
game systems -- or if they do, they have both in their house and use
the computer more for applications and netting than games.

I mean, *I* would love to see keyboard attachments for past and
existing consoles, but I've got my hands in a lot of pots, so I like
doing lots of different things, including gaming. The average teen,
tho... they want a Dreamcast to play games, and really couldn't care
less if it could run Microsoft Word...

>I think Foster L. Putnam had the right idea. If I didn't have other
>requirements for my time and room pulling at me, I'd still have the Atari
>system set up next to, and connected to, my PC, to do what it does best.

So would I. I've been a loyal fan and stolid trumpeter of Atari since
the first day I brought home a 600XL way back in '85. I loved the
machines -- all of them -- to bits, and I really wouldn't change
anything about them. The 8-bit did what it did for its era extremely
well, and changing it would sort of be like trying to fix what ain't
broke...

>5200 introduction?

That was Atari infighting. It was stubbornness and stupidity that
caused the 5200 to have a different cartrige design, making it
incompatible with standard XL/XE carts.

>That said, I respect everyone's views, and I always felt the same way

>and where is the documentation on the custom chip registers...You say it has
>microcode ? Can I reprogram that too?'

Sure, but how many people like you are there? I like to program, too,
and love getting right into the bits of a system to make it purr, but
we're a very select group of hackers, dabblers and tech junkies who
just revel in getting inside something, tearing it apart to see what
makes it tick, then figuring out how it could be made better. No
market could ever survive on this crowd. Do gamers want computers,
too? As I've said before, it's two completely different demographics,
and no matter how functionally similar a particular computer might be
to a particular game console, the gamers will *always* buy the
console, even if the computer does all of the same things, runs all
the same games, and offers them the opportunity to do more than just
gaming. See, I bought a computer because I realized that computers
could play games as well or better than consoles of the era, *and*
they were programmable and could let me do so much more than a console
could ever hope to. But I'm the sort of person who wants so much more
out of a system than games. I want to have the opportunity to do

other things, and to make it do what I want it to do. Gamers don't. They don't really even think about that end of things. They just want to play games, and what could possibly be better for playing games than a machine made especially for the task?

Oh, and what the hell, parallel fiber optic I/O.

Well this thread has stopped being fun. The 'new Atari 8 bit' I supposed,
would be a cheap, hobbist machine. Something to play on. As I said before,
NO ONE is going to work on the OS or the drivers...I can tell you that RIGHT
now, so why bother talking about this. I started this thread just to knock
around some ideas on what was possible, or feasable.

I finally downloaded the QNX demo floppy about 6 hours ago. I was really
impressed with it. Anybody who thinks windows
is a good product needs to download it, write down your DNS and PPP login
username/password, boot it up and test it out.
It does have a few rough edges, but all in all it's awesome.

1. The interface is built into the ISO connector. I wouldn't have known if I hadn't checked with an ohm meter. I opened the connector and there sat the 14C89 chip. That is all I saw though, no other components. And yes, everything is buttoned up.

2. The only thing I have in the chain is the Percom drive and the ISO2PC. I did clean the connector pins on the Percom. With the ISO cabled connected there is no reaction from the Percom at all. If I try a cold start with the cabled connected and APE bay 1 empty, I get a READY prompt and then self test when I type DOS (like no disk drive at all). With a DOS in APEs drive bay one, the Atari boots up with no complaint.

3. I'm running a 130XE. Ape is set up for RI, but I don't know about the ISO2PC, or if the interface is RI.

I know this isn't much info, but its all I have at the moment. I've got two 1050s coming in in the next week or so and would like to figure out this present problem before opening up a new can of worms.

Don't knock it- low speed USB is a fairly easy interface to deal with.
You can get chips with USB tranceivers built in, needing only I/O
conditioning parts. Inside, the USB hardware gives an interrupt
driven packet rx/tx model. It wouldn't do for a hard disk interface,
but it wouldn't be unreasonable to rig a USB interface for a Atari
joysticks, and maybe original Atari floppy drives.

IMO: Atari's weren't cheap until after the Tramiel take over. Conditions that existed were kind of two fold.

You had a cash cow in the VCS, and a company that pretty much said ~Damn the cost, build a great machine.

Then you had that company sold off in fire sale type mania. All the assets were almost given away.

The same conditions could exist again. Somebody like 3Com or Sun could decide to build the box of our dreams that ends up costing ~$10,000 when you scale up 1979 dollars to todays. Something like a really nice workstation for video.sound editing like made for Pixar. Using the same senario of failure and take over, you would then get them being sold in the mass market for $1,000 bucks each.

OK, if it doesn't have a small signal diode like a 1N914 in there, do NOT
use it with the Percom. Cables w/o the diode are meant to be the only thing
hooked up to the Atari.

Don't be silly. The Atari community (and a lot of hobby communities)
always develop add ons and hacks as technology becomes cheaper. So we tend to
be about 10 years behind the power curve. But I'm sure people will continue
adding things as they are found in "As-is" piles and used electronic stores.
We are too curious a group to do otherwise.

What is really amazing is to look at what Apple II became for many users.
As the Macintosh was beginning to take over in the Apple II/Mac conflict that
Jobs so nicely inflicted in Apple, it was running Macintosh systems, DOS
emulation, running it's own stuff, and playing music in quad stereo.
It would take the Macintosh YEARS to touch that.

Moral of the story, the Atari in it's form today is far from what it was
two decades ago, and far from what Atari intended. It has grown.

You can take an Atari, hack it up to 1 meg (or more) for a nice fast ram
disk for your regular applications, put in a graphics interface if you want
using an Atari mouse (or some other mouse I'm sure), connecting to some device
to run a hard drive for you, and a variety of interfaces to run some nice
printers.

Really a very usable system by many standards. :)

Personally, I prefer an 800 with 48K to call a local BBS to check E-mail.
Nothing fancy, but fast, and no hard drive having to spin 24/7. Works for me.

> Edison

As everyone knows here (or might not), I tend to have fun skirting around
the Wintel world, so I love to use an Atari ST as my harddrive interface.

Take ANY Atari8 with 48K or higher (Hmmm.. maybe someday I'll try my Atari
800 with 24K or 32K to see if a disk drive can be used.. but I digress).

Any Atari ST,STE,Falcon (and TT I believe) with 4 meg ST ram.
A program from the internet called "800XLDJ".
And most importantly, a cable that you can get a nice version from Steve
Tucker, or Jason Worley or several others, known as a "SIO2PC" cable, which,
since we are connecting a Atari8 to ST becomes a "SIO2ST" cable by application.
(grin)
External SCSI frive (if it was not a type that had an internal drive) and
a way of connecting the drive to the ST (ICD Link II interface, etc)

With this, 800XLDJ is able to create virtual disks for the Atari8 in the
strange but useable .DI format. Other types of compression files.. .ARC,
ATR, .DCM, and other can be read and uncompressed by various programs for the
Atari8 and then saved in the .DI format for later use.

Fun format, and one I use everyday.

A few years ago Tiger released the Apple II in a much simpler form. That
was pretty cool.

I still think a message pad designed from the ST would be fun. and even
an Atari8 with the same size that could be written to look at flash roms as
drives would be fun.

Just bare in mind, even if we made the technology smaller, many would
flock to see it, buy it, and so forth. (kinda like with the Wonderboy
(minititure 2600 with 126 built in games) but have you seen what is out there?
They can emulate our games, and play others that by stats alone (can't say for
gameplay) are many times more impressive.

Think for a little bit, what can we or any new Atari company offer? What
niche can be filled? How would you spark an interest in a new generation?

Food for thought.

It's OK, I just tore the connector apart and took a closer look. There is a diode connected to pin 8 of the chip and the orange lead of the sio connector (as per your diagram for the 1489 interface).

Why not create an installable card (just like a soundcard or graphic
card) for the PC that has all nescessary Atari chips on it... then write
an emulator (or patch the existing ones) to use that card ?!?
No computer emulation would be needed and with Antic, GTIA, Pokey, etc.
present the emulators would have less problems ... any volunteers ???

That makes it a little tougher. I don't have a Percom to see what they do to condition their I/O.

Anybody out there have a Percom with an SIO2PC cable attached that works?

About the only thing I think I know about Percoms is they are set up to handle multiple drives in the same box, could be something to do with that. Maybe try using MyDOS with the SIO2PC drive really high, like D7: and see what happens.

[snip]

Hey there,
so lets built up a time-machine, go back to the past and start the 8-bit era all over again. Make Atari 8Bits the biggest computers all over the world (lead Commodore into meaningless nothing), finish the Atari sweet 16 projects (and thus give an end to the pc world) and create an unbeatable 8-Bit Atari that still has life in the 5th millenium... (yeah dreaming can be so coool !!)

Next, "force" any software engineer to produce for Atari, get all great games like AR part 1 to 7, Lucasfilm Maniac Mansion, Zak Mc Cracken, Indiana Jones, Starwars X-Wing, B-Wing, Rebel Assault, etc., Doom, Lara Croft, The Last Ninja and many many more games released for Atari 8-Bit... Damn, I wish I had that time-machine...

(and then realize what I have done wrong, by chanching the time: Atari would have been the superior computer company and thus Atari and not Microsoft would be punished by law; and maybe if I changed the time very badly, in 1996 Atari would have starded its new supercomputer, that controls all weapons all over the world and in 1999 this computer decided to wipe out all mankind by starting a nuclear world war and creating TERMINATOR machines... who knows ?!?
Better not change the time, you cannot see what happens then...)

In article <0002.3958e81c@fmlynet.org>, Greg Goodwin <Greg.Goodwinp0.f2.
n8.z8@fmlynet.org> writes
> What is really amazing is to look at what Apple II became for many users.
>As the Macintosh was beginning to take over in the Apple II/Mac conflict that
>Jobs so nicely inflicted in Apple, it was running Macintosh systems, DOS
>emulation, running it's own stuff, and playing music in quad stereo.

Erm? Quad? The IIgs used an Ensoniq chip offering 31 oscillators, or 15
channels of stereo sound. It was good, but not quite that good ;)

smiles The Apple][family is a great example of how to manage a
product line well. It covers 4 distinct machines (5, if you could the
Apple ///) all of which are at least 80% compatible with each other.

The IIgs, however, presented a unique problem for Apple. Running at the
original speed of 8Mhz, it outperformed the SE - yet cost less, and
offered colour.

However, it wasn't running Macintosh systems - GS/OS 6.0 didn't come
out until 1989, and if you count the earlier models they didn't have a
full toolbox in ROM - it would take until 1990 and the ROM 03 version.
Mousedesk, which also ran on the IIc (and //e, and IIc+) was closer to
GEOS.

DOS Emulation in the early days was no harder than CP/M. You used the
computer as an IO device for a separate computer on a card.

> It would take the Macintosh YEARS to touch that.

Not really... although colour took too long (1988, officially), the Mac
could emulate (to the same extend as the Apple II range) a PC in 1985
with MacCharlie, it had a higher resolution screen, and it always
offered a very sophisticated 4 channel sound chip.

And Apple, unlike Atari and Commodore, did provide a legacy link in the
form of the Apple II card for the LC. They had to do something with all
those VLSI Apple //e chips they designed for the final revision of the
IIe!

Hi there,
maybe we should do a list for programmers, that have some spare-time and like to do something for the little Ataris. A so called "wish-list" that includes the most wanted games and game-conversions for the Atari 8Bit series. (Thinking of so many C64, Apple-II, Spectrum, Amstrad, NES, Genesis, Amiga, ST, PC, etc. games that I would like to see in a playable form on the little Ataris...)

The 1489's only put the equivalent of ~4k load to ground<less when you consider it is through the base of a transistor>, on the output lines. Hard to believe there is something in there that can't drive it to proper logic levels.

Only other thing that I can think of off hand is maybe adding a decoupling cap to the 1489.

I've made maybe 20-30 different versions of the cables just jerking around. Only tested them with 1050s and 810s, but they all seemed to work. I gave about 1/2 the cables away and sold the rest cheap to cover some of the costs, but I don't think there was a single complaint back that the cables weren't working. Could be the Percom thing.

Another extension of the 8-bit line would be to combine all the chips
(ANTIC, GTIA, POKEY, 6502, and 128K of RAM) onto one chip as a
competitor to the Basic Stamp (and embedded microprocessor used for
robots and other electronic projects).

If a 8bit clone was built the size of a palm-top computer, complete
with LCD, cartridge port, USB, etc., this would be ideal. If it ran most
of the old software (especially the games and term prgs), I'd buy it!

The A8 and ST computers are just as powerful as current palm-top
computers, AND if an atari clone palm-top existed, it could take
advantage of 15+ years of software.......

Hmmmm.....just being able to take the computer with you..... ;-)

Just a thought!

>beyond current bleeding edge PC GFX cards.

Not really. Ge-Force and the Voodoo5 with on-board dual SLI are
pretty comparable. I've read the specs, and there's not much the
X-Box will be able to do that modern high-end PCs with decent cards
won't.

Plus, the X-Box will probably cause a lot of people to die of sticker
shock; last I had heard, its initial price was slated at $499...

Hi,

I had posted this message before about if there was a way to connect an Atari 8-bit to a VGA monitor. A gent came back and told me to buy the monitor cable that hooked up to the computer and had two RCA jacks at the other end. He also told me about a graphics converter which I ordered. Now my question is, how do I get sound? Do I buy some cheap TV and use that or what? Is one of the RCA jacks an audio jack???

Howdy Greg, folks

> Personally, I prefer an 800 with 48K to call a local BBS to check E-mail.
>Nothing fancy, but fast, and no hard drive having to spin 24/7. Works for
me.

Excuse me, but the ages we Atari 8bitters live in are not THAT dark. Spinning
24/7..... Heck no, I switch my Harddrive of when I switch of the power
supply in my minitower. Just like PC users do. It's just that my Mini Tower
doesn't have a PC inside. THANK GOD!!!!!

CU Mathy van Nisselroy

PS a ZIPdrive stops spinning after it hasn't been accessed for a while (sp?).
If BBS owners would use ZIPdrives, they wouldn't have to keep their harddrives
spinning 24/7 either. There is even some hardware that will power a computer
up when the modem detects a RING.

Howdy Tony, folks

> While delving around the web, it dawned on me that the Super NES uses a
>65C816 (I think) and its own custom graphics chip. It has multiple modes,
>256 colors, and more....hmmmm

Problem with most graphics chips is availability.
Problem number two is, who is willing and able to write the software for them.
Problem number three, how hard is it to hook it to the Atari.
Problem number four, how high is the price.

I know this great chip intended for the MSX computer (no text ability, but 512x512x32k colours), wouldn't be to hard to hook to the Atari. But it probably needs a three layer PCB (which is expansive). And up till now, the only supplier I have heard of wants you to buy a minimum number of these chips (Yamaha V9990).

I tried the 8563/8568 of the C128. Problem is this baby is badly documented and even it's own developer doesn't like it. But it will do 80x25 or 80 x 50 text and up to 640 x 480 pixel graphics and more. I have a prototype soldered together, but I don't speak assembler, have no time to learn it (yet) and don't know how to initialize the chip.

CU Mathy van Nisselroy

PS If I need anything for my XE (I alreay have a BlackBox with FloppyBoard, ZIPdrive, harddrive and CD ROM player) it's the ability to use 80 columns. I have XEP80's but they are SOOOOOOOOO slow. Probably Atari's fault, because the video processor can handle 16 bits, 64kB and colour.

When you say it can handle 16-bits, do you mean 262,000 colours, or
16-bit addressing?

It sounds suspiciously similar to the 128 Chip, in some ways, but
Commodore only provide a TTL level output - I wondered if, given the 64K
RAM in the DCR, a different output circuit could provide analogue RGB.

Richard, has never seen an XEP80.

4020. FS: Atari 1020 Color Plotter, Epson Printer, and 2 Mac Pluses

Newsgroup: comp.sys.atari.8bit
Date: 2000-06-28 00:00:00 UTC
From: mjj14@aol.com
Message-ID: <20000628130936.01946.00000313@ng-mf1.aol.com>
Source record: 43886

Hi,
I have the following items for sale:
-2 Macinotsh Pluses - one of them has a non working floppy drive, other than that it is in perfect condition and the other one has a bad picture tube (you have to let it warm up for 5 - 10 mins before it will come on), other than that, the second one also works perfectly. Both come with the original Mac Plus keyboard and mouse and the first one to get sold comes with a power cord (sorry I don't have 2) and some copies of system disks for the Plus. Any more questions, just e-mail me. You can see a pic of one of the Pluses (they both are actually very similar in condition) at:
http://members.aol.com/kjj58/MacPlus1.jpeg
E-mail me a price.
-Epson MX80FT Dot Matrix Printer - I have no clue if this printer works or not, I think it is for non-Apple computers anyway. It has not been tested whatsoever, so I can't guarantee anything. E-mail me if you have more questions. You can see pictures of it at:
http://members.aol.com/kjj58/EpsonMX80FT1.jpeg
http://members.aol.com/kjj58/EpsonMX80FT2.jpeg
http://members.aol.com/kjj58/EpsonMX80FT3.jpeg
E-mail me a price.
-Atari 1020 Color Plotter Printer - this unit is also totally untested and it is for use with Atari's 8 bit computer series. This is for the printer only, no power adaptor, sorry. If you have any questions, e-mail me. You can see pictures of it at:
http://members.aol.com/kjj58/Atari10201.jpeg
http://members.aol.com/kjj58/Atari10202.jpeg
E-mail me a price.
Thanks so much! I am flexible with the prices though if it comes down to a few dollars here or there.
-Matt

Where? The one version I could find which I downloaded still had the copy protection. The program cleverly recognises that it is a copy and, after approximately 45 to 60 seconds, totally blacks out the screen! Brilliant protection. It gives you just enough of a taste to want to go out and buy it, but not enough to actually fly the plane.

I have bought many versions over the years including two for the Atari 8-bit (one new, one garage sale), one for the ST, one for the PC and one for the Mac.

I LOVE FSII! And I really want to use the program on an emulator running on my palmtop Libretto...

No.....Not unless what you have is a spreading virus that I got :-)

Seems like that was written under the influence of a drugs experiment?

Perhaps its a test of a new Artificial Un-intelligence program?

Perhaps the person who wrote it is just really thick?

All these questions and more may never be answered :-)

I have access to TI DSP programing tools and chips. I remember my dad
telling me once that you can take all the logic from a Atari, rom and o/s
included and *possibly* program a DSP to emulate it. Add an extra module to
output to LCD or Analog VGA + sound and you should basically have an atari
on a chip. Anyone ever try this before? Give me something solid to try and
i'll take a shot at it.

>
>--Robert Cortese

Theoretically a DSP could be programmed to do anything. It's about as
general purpose a chip as you can get. you can use it for sound,
logic, or an entire system, really; you could theoretically have, say,
an MC68001 DSP programmed to work as a 6502, Antic, GTIA, and Pokey
all at the same time. I don't know how effective it would be in
practise, but it works on paper...

I went to the site and checked it out. There's a flash game loosley based
on the old last ninja game, also there's techno remix of the old background
music too. Worth a look.

Ah, so he went to the I'll post a real wacko, look like an idiot school of site promotion :-)

Still, I hate people who write like a 'wArEz'/ zonked outta their mind 'Dood', reminds me too much of the sysops around in the Amiga days.

probably i can give you an answer:
yes: we are under the influence of a drugs experiment, but we are NO amiga
sysops :)
probably more like C64 zombies playing gameboy and surfing the net on a
PentiumII... but the website is all about low-tech music. keep on rockin'...

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

OTHER USENET NEWSGROUPS:

Anybody out there have a book and/or wiring diagram for ICD's
P:R:Connection? I have the interface and the software, but no
documentation. Someone has removed the sio cable from the interface. I
have a loose sio cabled, but no map to connect it with.
If you have anything I can use and no way to copy it, loan it to me and
I'll scan and copy it...even make you a copy, if you want one. I would
be more than happy to pay the postage both ways.
Lee

Hello Tony,
this thread was not so bad - all in all. But, with our current 8Bit ataris we have hundreds or thousands of users, also thousand software items (games, demos, applications, etc.) that run with them, hundreds or thousands hardware applications/upgrades that can be used with them and so on...

With a new(er) machine - how many users would buy or use them ?? (tens, hundreds?) How much old software would work with it and how much new software would be produced especially for the new atari ?? (none, little, etc. ?!?) What old hardware would still work with it and especially what new hardware would be usable or produced for a new Atari ?!? (none, little, etc.)

That`s why most users are not interessted in a new Atari, they like what they have. And even those who might be interested (like me), already know, there will be compatibility problems, not much support with new software/hardware and so on... You can of course have a totally new Atari with new OS, new mhz or ghz rate, more ram, better sound, better graphics, but whats it good for if less than 10 users own such a thing ?!?

In my eyes it would be much better to support upgrades for the already existing machines. Like new OS`s (still running with 1,77 or 1,79 Mhz but with new features), sound-upgrades (second Pokey/gumby, polish covox upgrade, polish SID upgrade, sound card via parallel bus upgrade, Amy/Amie upgrade, etc.), graphic upgrade (second Antic and GTIA installation, graphic card via parallel bus installation, etc.), Ram upgrades (Ramdisk with up to 1 megabyte Xe-compatible, second PIA+Pokey and thus Ramdisks with up to 256 Megabyte non-Xe compatible for whatever reason, etc.;) and other things you may think of like floppy upgrades (3,5" with 720k or 1440k), harddisk upgrades (IDE, SCSI via parallel bus or SIO, etc.) and many other things. This still has the same disadvantages (lesss than 10 users maybe), but at least you can use your existing Atari computer...
greetings - Andreas

Well,
if you think of the blue boxes for XEGS carts the answer is no - Super Breakout does not come in such a box or as such an XE cart.
But there is the old A800 version avaiable in a big black box with an old 800 cart with orange-brown label... Not easy to find in Europe, but easy to get in America (look at Best Electronics, Video 61, B & C Computervisons, Bravo sierra computers, etc.)
happy hunting - andreas

4036. Soundmon Prof. manual

Message-ID: <395B5185.8F667024@mail.uni-mainz.de>
Source record: 43654

Hi there,
I just read that a little 8-Bit machine (running with approx. 0,9 Mhz, using sprites instead of players & missiles, using SID sound instead of Pokey sound, etc.), now has its own internet browser. With this browser there is no emulation needed on any PC, it runs directly on the 8 bit computer !!! So, finally - we have an approx. 1,8 Mhz machine, how about an internet browser for our little ataris ?!? greetings - Andreas

P.S.: There is an internet browser for the C64 avaiable now, but none for the A8, that can`t be true !!! Make it possible, please !

Well,
a not so bad thought. Our little A8 as small as a portfolio, but still
usable and compatible. Loading the software via flash cards, like the
portfolio does... Why did not Atari have had that idea ?!?
greetings - Andreas

Well,
I am unable to build such a card. But it would be an easy way for
emulators to emulate old computers. they just check for the avaiability
of that card (the desired computer or console) and then load in the
software (from pc harddisk) without any problems...
In other words: use one emulator and install any "card" which contains
lets say an atari 800, or atari vcs 2600/5200/7200, or C64, or apple II,
etc. No more emulating problems, because the hardware (the appropriate
computer card) is physically there...
greets - Andreas

Wave? I've seen it, but haven't used it yet since my 128D is missing a
keyboard.

GEOS makes life easy for such things. Does the Atari have a GEOS
equivalent?

My soldering skills are truly appalling, but I downloaded and printed
the upgrade lists linked from BRiTiSH...

Is there anyone who would build a machine for me, who has the skills?
Like either a fully 130XE compatible (i.e. Freddy capable) 800XL with
320K, or a 320XE, and install a Gumby upgrade? The stereo sound upgrade
is most interesting, since my monitor is a CM8833Mk II and would have a
very neat installation.

And what of this SID up(*coughs*)grade?

I'd hate to trash a perfectly good 8-bit to get these upgrades, but I
also would quite like a Stereo sound, 320XE...

Hehehe.. now there is a fanatic. I think if I got approached by someone
outside a store like that and had this slight gloomy approach, I might have
taken the game system back.

"You know, Nintendo is looking pretty good about now." :)

Gotta love it. No, I barely knew of the XEGS. I had my Atari 400/800.
The XL series became popular. And by the time I was getting out of it all, I
remember faintly hearing something about a XE game system, to which I said,
"Well... don't we already have the 5200 doing that?"

I remember people somewhat clammouring for 1200xl's.

Never heard of the 1400 or 1450 XL till years later.

More toys! *hops*

I see mods for getting TTL colour, too...

Anyone ever tried to fit an 800XL (or even, and this might be easier, a
65XE VGS) into a Commodore 128DCR casing?

watches his C128 shake with fear in the corner

Purely out of interest, of course... >;)

Richard (going to the ABBUG (would that be Bit-Byters by any chance?)
page later - wondering if I can find a Happy 1050 mod for one of my
1050s, too).

Seems to me that back when ('90-'91) there was a version of GEOS for the Atari 8-bit. I had a copy of it (I think) and messed with it (I think), but never anything more than that (If I did).

> i'll take a shot at it.

Okay, I like this idea. I work here at TI with the
c6211/c6711 team. This should be possible, given
memory constraints....would it all fit....I dunno. This
just needs to be looked at. I have never heard of this
being done before, though....

I've been kicking aroung an idea of building a palm-top
computer that is A8 compatible. I thought that maybe I
could use a FPGA to emulate the Antic, GTIA, and Pokey
chips. Then connect that to the 6502. But, your right,
what is to stop you from emulating the whole system.
It should be possible to build a board with a DSP to
emulate the whole A8 system and connect it to an LCD.
So we are talking about a hardware emulator, not a
software one.....cool!

I also have access to the latest TI DSP tools and DSPs.
Though my programming for the DSP is a bit rusty. If
you are interested in working on such a project, I would
be more than willing to lend a hand. Also, if anyone has
any information, anything at all, on the Antic, GTIA, pokey
an etc. Let me know. I have some technical documentation,
but it is not complete....

L8r 4 now,
Chris

Actually, it's an ad, but only a teenager can decypher it without thinking
twice!

On the other hand, IIRC, there are some people around this ng who deal with
that kind of music production. Maybe they can shed some light?

Look lets just make a 256/512k version of the 130xe, stick a proper serial
and parallel port on the back (and fool the os into thinking that its an
850) so we can use PC external gubbins, a selectable gui interface, say
diamond? on cart or internal chip as well, and maybe stereo sound.
oh and maybe an IDE interface for a hard drive and a 1.44 floppy?

Why?

for years people have been shoving more memory into their boxes.
the 850 is highly sort after for its parallel and serial ports,
stereo sound is nice and I have seen the odd conversion to that
GUI? well why not? one or two have been created and should do the trick.
ide for common hard drives and 1.44 floppy cause it wont be long untill a
51/4 inch floppy will be a rare as hens teeth?

it will still be dated, proberbly overpriced, only true enthusiasts will
buy it, most likely after the company has gone down (again) but that would
be an atari 8 bit
'cause what i can see comming out of this don't seem like the atari 8 bit
I know. Maybee some one should look at the sam coupe' for an example of an
8 bit machine (compatible with the spectrum, but wipped the floor with all
other 8 bits, 'cept that the ST and Amiga were marginaly more expensive
and seemed better bets, thats why you proberbly have never seen one)
Just my 10 pennies worth

The c6211 looks like it could emulate about 10 6502's at once + the custom
logic from the specs I saw on the website...
I'm guessing the emulator will run from SRAM, copied from rom. You could
offer two options. One that initializes the emulator, and another that lets
people see the bare metal. That way people could directly drive the
hardware/bypassing the emulator, or even implement other machines. While
this may add a tiny bit more work, I think that heaps more people would be
interested/ you might even create a market. If it seems too hard then
that's cool too. We used to do this with the emulated systems I worked on.
We would move a jumper over to install a monitor that could read S19, and
dump it into RAM. Then once the download was complete, move it back and hit
reset... At which point the PLD would switch the ram to RO
program memory (80x51 based)... It saved us using eprom emulators.

Do free/cheap c6211 development kits/software exist ? Are you going to
setup a website somewhere/need help with the software ?

Well a bit of a confession, I have no programming skills to speak of whatsoever. (i'm a sysadmin) What I can offer if we *were* to start on a project like this is most importantly cash for parts, My web page making skills (I'm thinkin a mysql/php slashdot lookalike) My solidworks skills (if we ever make it to plastic mold injection for a case) and i'm sure my dad would love to add in what he knows about atari's as well. If someone could give me the code and instruction for getting the code into the DSP I could do that too. I'm big time in favor of doing this as i'm sure everyone else is. Amazing to think one of these DSP chips could emulate 10 6502's at once :)

Okay, I was thinking of putting up a section under
my atari page:
http://www.hackedup.com/atari

You are more than welcome to help out. Or, if you
want to put up a page somewere else, that would be
fine too. Okay, time to get that mailing list,
discussion board, and status page up and running....

I really think that the way to go now would be to
port the Atari800 emulator to the C6x DSP and work
on the hardware interfaces for the the joysticks,
keyboard, SIO, cartridge, video, etc....

The Emulator I was thinking of porting is:
http://cas3.zlin.vutbr.cz/~stehlik/a800.htm

This sounds highly portable.....

> > Do free/cheap c6211 development kits/software exist ? Are you going to
> > setup a website somewhere/need help with the software ?
> >
>

I think that there are GNU tools for compiling
and assembling for the C6X DSP, but I am not
sure, I will look around. I also have a few
people at work interested and also looking....

I do have access to the TI tools at work, but
I cannot exactly give them out. Although, it
may be possible to give them out to students.
I don't know. Again, I will look around about
that too...

And, yes, I am going to set up a
status/progress webpage.....

> > Do any free tools exist ?

Still looking. I'll keep you posted....
Hmmmm, I need to get my hands on a few
evaluation boards.... ;-)

Talk to you all soon....

That was called GOE (Graphical Operating Environment). I have a demo of it somewhere in my Atari 8-bit library.

I just got two of them and can't figure out how to set them up to work as drive 1 and drive 2 on my 130XE. I have no documentation so I really don't know I'm doing.

One other thing, using one of the drives as a boot drive, I have my iso2pc cable hooked up. In APE, I have drive bays 2, 3, 4, 5, 6, and 7 loaded. I can address D2:, but nothing else.

Can someone tell me how to set these suckers up, please.

4061. Announcement: Atari Manuals in HTML format

Newsgroup: comp.sys.atari.8bit
Date: 2000-06-29 00:00:00 UTC
From: Nelson Nieves <support@celebritybase.net{nospam}>
Message-ID: <8jgrbu$p65$1@bob.news.rcn.net>
Source record: 43678

Hi all,

Recently I started working with my Atari 8-bit computer and started using the Atari800Win emulator and found that some of my SpartaDOS utilities did not work with SpartaDOS 3.3. SpartaDOS 3.3 seems to be a favorite among the Atari 8-bit emulator users. Some of the utilities (those that use the recursive tree routines) have a detection code built into them to configure themselves appropriately depending on the SpartaDOS version being used. I have modified this code to handle SpartaDOS 3.3 as well. These new versions of the utilities will be made available soon.

Also, I have taken on the challenge of making available Atari manuals in html format. I decided to start with the SpartaDOS X manual. This manual is still incomplete but I am making great progress. Available chapters:

4 The Command Processor - Commands
5 The Command Processor - Advanced Features
6 Programming with SpartaDOS X
7 Technical Information

In the months to come I will be making available a lot more, such as the MIO, Toolkit, and R-Time8, and the SDCS (SpartaDOS 3) manuals. Stay toned!

Main website:
http://www.celebritybase.net/atari8/

SpartaDOS X Manual:
http://www.celebritybase.net/atari8/SpartaDOSXManual/

> but it is not complete....

I've burned a few brain cells reverse engineering the GTIA and ANTIC. Don't
have a clue if I am close to what Atari did, but I think in some ways it may
be better since I have a rough idea how to do it on the cheap and maybe make
it analog VGA. A FPGA should be able to handle it since it doesn't take more
then a handfull of 74xx type logic to implement it.

ANTIC is pretty straight forward, just a Harvard Architecture processor with the instruction in the upper nibble and the data in the lower 4. I guess a DSP would be fast enough to do it w/o jumping through too many hoops.

Here is an approximate plan for emulating the bit map modes. Forgive me for left out details, omissions, and mistakes as I am doing this on the fly from memory. Never can find my notes when I need them.

~14.318 mHz<?> dot clock going into a 4 bit binary counter<~74191>. The outputs of the binary counter are passed to a multiplexer<~74151> and the output of the multiplexer goes into the CLK of a 8 bit parallel load shift register<~74166>.

In operation, the DSP would determine the graphic mode for the line and store a value in a latch<~74174> with its outputs tied to the multiplexer. For example, graphics mode 8 would use 14.318 mHz divided down to 1.79 mHz to feed the shift register/dot clock. graphics mode 15 would use .795 mHz.

This would produce that same pixel type data we have with a real Atari, clocking the shift register at 1/2 the fastest rate for double width, 1/2 for quad, etcetera.

To recover color information, we would need at least 3 latches feeding ~4 bit D/A converters. This could probably be done with just a resistor ladder or at most a resistor ladder with a quad op amp like an LM358 buffering the signals.

In operation, the DSP *always* writes a full 8 bits to the shift register, the upper nibble just doesn't get clocked out and isn't needed since it only carries color register information vs screen data.

The DSP always writes to the color latches for every byte based on what the color register holds. i.e if the color is white, then each of the latches would get a 16 for the value. If it is bright blue, then two video latches would get a 0 while the blue video latch would get a 12-16.

To make it compatible with VGA, I think all you would have to do is display the same line twice to get 320X200.

I am thinking by using at least a 14 mHz clock, you should be able to do a real 640x480 in black and white at least, but I haven't sat down to do the calcs. I am assuming a DSP is fast enough to write 80 bytes of data to the latch on a single horizontal line anyway.

If you don't mind, how much do these c6211/c6711 puppies cost?

4064. FREE Atari Catalogs! Discounts! More Atari! Free stuff!

I update my catalogs once a week. Just before this message is posted. So when you see a new posting, check my Catalogs. After I post this message. I'm off for the weekend. But I'll be back after the weekend.

If your looking for my Free catalogs, skip to the bottom,otherwise read on. I've added new items to my Catalogs, including, for the first time, ST Hard Drives, SyQuest 88 Meg removable Hard Drive, Software, Books, Light Pens, Atari Touch Tablet and some Cartridges for the ST like DVT VCR Hard Drive Backup, ST Replay & Computer Eyes! So come and Get it!

e-mail: atari@benjamin.net

To take advantage of Discounts, FREE Monitors or FREE Jaguar Cable, you must E-Mail me to Claim it & state what you want in E-Mail.Be specific!

Discounts! Buy now! 5% Discount with a $50 Purchase. 10% Discount with a $100 Purchase. 15% Discount with a $150 Purchase. And a 20% Discount with a $200 Purchase. Discounts Apply to Classic Atari 8 Bit, Atari ST and/or Atari Jaguar. Hardware, Software, Books & Accessories! Shipping not figured into Discount.

FREE Monitor with Atari Purchase! Buy either an Atari 1040STF, Mega ST2 or 1040STe & receive a FREE ST Monitor. Your Choice of a Color or Mono-Chrome Monitor. FREE Monitor when purchasing an Atari 8 Bit Computer. Buy an Atari 800XL or a 130XE and receive your choice of any Monitor in the Atari 8 Bit Hardware Catalog. And FREE when purchasing $50 worth of Atari Jaguar items, receive absolutely FREE, a +NEW in the BAG Jaguar Stereo Audio/Composite Video Cable.

Offer Available for Limited Time only. First Come, First Serve! Subject due to availability! Customer pays Shipping! Substitutions considered.

I've added more and will be adding more Hardware, Software, Books and Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out into Atari Jaguar Hardware & Games. So checkout what's new on my Web Site. In Fact, check it regularly as my Catalogs are updated regularly. Customer's are served, first come, first serve! No competing in auctions. Just Sales, Support & Service! I have 8 different Catalogs, & my SoftWare Catalogs are my largest. They have the biggest Byte Count. You should see my inventory! I have TruckLoads of HardWare, Boxes and Boxes of Software & Libraries of Books & Reference Material for the

Classic Atari 8 Bit, Atari ST & Atari Jaguar Game Machine! And
remember, if you can't come see me today, come see me tomorrow!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want and E-Mail me the rest! To expedite things, include your complete
Mailing address so I can figure your Shipping/Postage & Handling. I'll
be back after the weekend.

There are two drive select switches accessable through a hole in the rear of the casing. Looking into the hole, if you see only one black switch then the drive is set to D1:--to set one as D2: move the front switch to the right so you see white on the left (the rear switch) and black on the right.

> One other thing, using one of the drives as a boot drive, I have my
> iso2pc cable hooked up. In APE, I have drive bays 2, 3, 4, 5, 6, and 7
> loaded. I can address D2:, but nothing else.
>

First, a bit of nitpicking: it's SIO2PC not "iso2pc" where "SIO" stands for "Serial Input/Output" and "PC" stands for "Piece of Crap" (often anyway). Now, as to drive selection: if you've got real floppies hooked up as D1: and D2:, you must not set up an APE drive with the same identity.

Considering speed and wear and tear on the 1050s, I think my preference with your setup would be to boot from an APE drive as D1: and use the real drives as D2: and D3: or D3: and D4:. If you want to set a 1050 to D3:, move both switches to the right; for D4: move the front one back to the left, leaving the rear one on the right.

That's the latest version I've seen. The full package is included with the
MAC/65 .atr that fTE released (available on UMich and probably Tom Hunt's
site).

If it's really for use on an 800, make sure you don't try and use DOSXL.XL
and DOSXL.SUP.

4068. How to tell which Atari Basic Revision that you have

Newsgroup: comp.sys.atari.8bit
Date: 2000-06-29 00:00:00 UTC
From: w_a_lang <w_a_lang@willinet.net>
Message-ID: <slo5n0ddjev6@corp.supernews.com>
Source record: 43685

The memory address that identifies which Basic that you have is 43234.

So when you start your Atari up, at the READY prompt, type in this command:
PRINT PEEK (43234)

You will get a value of 162 if it is Rev A Basic.

You will get a value of 96 if it is Rev B Basic.

You will get a value of 234 if it is Rev C Basic.

Amateur Atari historian and Devout Atari game player,

Thanks for the information, John.
First of all, sorry about transposing the "s" and "i", I some times don't watch my typing as close as I should. I never was good with proofing either.:-)
By the time I read your post I had figured all of it out. I found all the switches and got the drives working correctly first.
The problem I was having with APE was the DOS that I was trying to use. What ever the reason, as soon as I booted up with MYDOS4.0 everything worked great. I'll take your advice about using APE bay 1 to boot from.
Thanks again.

>my question is, how do I get sound? Do I buy some cheap TV and use that or
>what? Is one of the RCA jacks an audio jack???

Well... you should get the cable with >4< RCA jacks at the end
(the other end is a DIN 5-pin connector), of those 4 one is audio,
the others are composite video, chroma and luma. I suppose the two
you would be using are audio and comp. video... the pinout is
in the A8 FAQ.
You could connect the audio output to your stereo line input,
or do as I did, I got a pair of PC speakers (no, not the internal
thing! those for soundcards!) and made a cable to connect them
to the output of my VHS (which is stereo, while my TV isn't),
and I hook the Atari outputs to the VHS inputs...

Sorry, that's 16 bit addressing. 64 Byte by 16 bits. It's based on the 8031
series I was told. It has a UART and everything built in.

The C128 chip (8563 or 8568) was based on the 6845 and 6545.
There are several schematics to be found in the C128 stuff on the net. They all
use a combination of resistors to go from TTL to Analog RGB.
If you have a Philips CM8833 monitor (or simular) look at schematic B (which I
do not have :-((( ) to find out how Philips did it.

>
>Weird :)

The dude who sold them (not Alan Reeve, he's a nice guy, but Shelly (Shelton) Merrill) send me the wrong stuff plus a rubber check after I told him I had a photocopy of my money order with his John Hangkok on it to prove that he HAD taken my money. If I ever meet him, there better not be any tar and feathers around!!!

But Tom Hunt has developed DCS (Desktop Construction Set). It's kinda like Diamond, but without the fancy (and time robbing) graphics. You can find it via his site (of which I keep forgetting the name). TRY IT.

>
> If you don't mind, how much do these c6211/c6711 puppies cost?

Okay, this has been copied from our
sales documentation, so forgive me
if it sounds like a sales pitch....

__BEGIN SALES PITCH__
The TMS320C6211 DSP Starter Kit (DSK) is an
inexpensive C6000 DSP development board
that enables TI customers to easily benchmark
and evaluate C6211 DSP performance and
prototype their C6000-based designs. The DSK
sells for $195 (US) and includes:

Hardware
- C6211 DSK Board
- 150 MHz C6211 DSP
- 4 Mbyte external SDRAM and 128 Kbyte
external flash
- TI's TLC320AD535 16-bit data converter
- TI's TPS56100 power management device
- JTAG controller
- Expansion daughter card interface
- CE-compliant universal power supply

Software
- C6000 C Compiler and Assembly Optimizer
- Code Composer Debugger
- DSK support software (flash utility, sample
programs and confidence tests/diagnostic
programs)

__END SALES PITCH__

So you can get a development board complete
with software tools for around $200. I have
looked for GNU tools, but I don't think they
are fully developed yet, so free development
tools are not available....I will confirm

this, however.

I can probably get my hands on boards here at
work, but I cannot give out the software tools.
So, we are stuck with the $200 pricetag.

Now, for the actual chips:

The C6211 running at 150MHz can be had for about
$35. That is the price for one, the price goes
down when bought in bulk of course. The C6211 is
the fixed point DSP.

Now, there is the C6711, the floating point DSP that
fits into the C6211 DSK. The 100MHz variety can be
had for about $35 and the 150MHz one for about $52.

All of these can easily handle the video output....

Okay, now for the real sales pitch:

The way I see this project progessing is the
following. Please note that this is just my
opinion, that I am always open to suggestions,
and that I would like this to be a team effort.
So, with that said, the idea of this project
is not to create a successor to the A8 computer
line, but rather to turn it into a new form.
This new form, I think, should be a portable
PDA-like computer. This way once you have the
hardware in place, you have all the software
already there for both games and business apps.
Ideally, I would like to emulate the A8
computer in a generic way so that the "portable
emulator" could be next applied to the ST computer.

This way you have a box that may be able to
emulate other platforms (portable MAME?).
I know that it may not be a cookie-cutter as
that, but it would be a nice goal to work towards.

I think that this is totally possible; it may
take a few years (depending on the number of
people lending a hand) but.....

Well, this is ambitious, I know, but you might
as well set your goals high....we will be able
to create something. It may be time to make
this a new disscussion. I will post more when
the development site is up.

For now, all those that want to lend a hand
with the software and/or hardware send me an
email to my work address: cmartin@ti.com

Once a list is created, we can start dividing
up tasks.

And, all those who would be interested in buying
such a thing, email me as well. Regardless of the
number of people who want one, there will be at
least ONE of these built. Then, we take it from
there.....

Talk to you soon,
Chris
cmartin@ti.com

ps - Rob, I am going to hold you to your word
on your injection molding talents ;-)

Look at the 800XL schematic. Its a standard 'poor mans' D/A converter.
Each resistor is 1/2 the value of the resistor before it, and the 'outputs'
of the resistors are tied together. This ANDs their voltages together. The
input to the resistors is binary.

Now this sounds interesting...

> it will still be dated, proberbly overpriced, only true enthusiasts will
> buy it, most likely after the company has gone down (again) but that would
> be an atari 8 bit

I think it would still be too expensive for the hobbyists that are still
using the Ataris:
130XE $35
Memory $30
Blackbox $300 (This would give you all the ports)
Stereo (Pokey) $10

I don't know too many people willing to part with this much money,
expecially since I've got almost all of this with my 800XL (with Rambo
upgrade) and APE hooked to my PC (I'm missing the stereo sound and
Diamond OS).

4098. Sparta DOS & APE 95/98

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-01 00:00:00 UTC
From: "Foster L. Putman" <fangmans@bellsouth.net>
Message-ID: <395E1AEB.4A7F69E2@bellsouth.net>
Source record: 43715

I am booting my Atari 130XE from APE bay 1. I have two 1050 drives configured as D2: and D3:. Everything works fine using Mydos543 or DosXL. When I try any of the Sparta DOSs, nada. The versions include 11h, 32f, 32g, and 32x. They start to boot and just stop. I have tried to download the .atrs, but get nothing usable.

I have one disk with 32e on it that boots up fine on my Percom drive, but it has none of the support files.

I would like to try downloading from APE to the Percom, but the Percom has to be the last in the SIO chain, and it has to be D1: or it won't work.

Does anybody have any ideas short of someone sending me a 1050 compatible disk with Sparta 32? on it?

No, it didn't. As I recall, no third party software was ever made for
it, so what came with the package is what you got, and I don't think
it was capable of using regular DOS software.

4100. Brand New Atari Jaguar Items for Sale/Trade

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-01 00:00:00 UTC

To respond to this message, please use the enclosed link rather than your reply button

- Last Updated 07/01/00
- Sold items removed

I have a limited amount of brand new Atari Jaguar items for sale or trade. These packages are ideal for new collector's or somebody wanting to start or add to their Atari collection. If you have any questions, please feel free to ask. I am also willing to trade for certain items, please see my list at the end of this post. All prices quoted are in U.S. funds with the buyer paying shipping.

If you are interested in any of these items, please respond to me by using this automated link jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.Jaguar (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

** Atari Jaguar Packages - Brand New (with controller, RF Box & AC adapter)**
==========
-.Atari Jaguar with CyberMorph cartridge and Composite Video Cable $45
- Atari Jaguar with CyberMorph cartridge $35
- Atari Jaguar (No Cart) $25

** Atari Jaguar Accessories - New**
==========
- Jaguar unit alone (No power supply, controller or accessories) $20
- Team Tap (4 Player adapter) $30
- Composite Video Cable $15
- Spare Controller $15
- AC Power Supply $15
- RF Switch Box $10

** Atari Jaguar Games - New/Shrink-wrapped**
==========
- Checkered Flag $10
- CyberMorph $5 (No Box)

Atari Force Comics Please make an offer
==========

All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for/towards rare or sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- A working 6000 series Dish Network receiver
- Working DSS H or HU Cards
- And of course the ever popular, original Intellivision keyboard
- Atari Force Comics Issue #1 (January 1984), Issues 4 thru 7, and Issues 12 thru 20

Source record: 43718

There are a couple of browsers being developed for the A8, and
not just the text or PC proxies. I am sure they will be beta
test oneday.

Diamond was O.K., I kinda liked it, but it only liked Atari DOS
and Sparta, I think. ANY specialized software the brings
together many functions(copy, disk I/O) and hardware(extra ram)
is by nature not compatible with other regular software that does
not know the replacement is there and that uses all of the
resources itself. Using Diamond, GOE, and MTOS is no different
than trying to run software made for the Atari 8 on a c64.

MTOS is another O.S., though concentrating on multitasking rather
than replacing the installed O.S.

And there are a couple more under development, I believe.

Rick D.

Hi, Doc.

Most of the chips are available from any electronics supply store
bigger than Radio Shack.

Yes, Best Electronics has many custom chips, many stock chips and
other parts as well.

B&C ComputerVisions may also have some of the custom chips.

Yep - he wasn't too sure of shipping to the UK, but since I was
heading over to Boston anyway it wasn't a problem to get stuff shipped
there. No bother - nicely packaged Atari 1200XL in better condition
than I was expecting and a still-factory-sealed CX85 keypad.

Go for it.

Hey! You're talking about my favorites of the Atari8 realm! (Being a big 400/800 fan ... use an 800 daily).

At least it was not a Commodore case knock off or ST wanna be like the XE was with it's greyish case. One thing you can say for those older beige cases... they were built like a tank!

This is true - I'm not one to break the factory seal on anything
unless I *really* have to :) Looking at other pix of it (plus others
have already answered) I'd say it was styled after the 400/800 too; it
certainly looks v.seventies!

Mathy,

I have a Black Box.

Are you saying that you can control an Audio CD from your Atari 8-bit via a
Black box?

Where do I get the program do that?

This sounds way too cool!

As far as reading data...

My understanding is that it would take an Atari DOS or SpartaDOS or MyDOS
modification to recognize 1024 byte sectors vice the maximum of 512K with the
Black Box??

Actually, the philosophy is more like "buy whatever you can afford,
and then some, because it will be outdated by the time you get it".
At least if you overdose on the hardware, you have a decent chance
of staying with the curve for at least a little while...

This brings up the question of syncing. Most newer VGA monitors can't
sync down to the atari/C64 (off the top of my head, ~15khz). They'll
(if your lucky) just blank out, else (if you aren't) they'll fry. The
NEC Multisync II monitors are a _very_ notable exception, and worth
their weight in old microchips if you can find one. They have _very_
broad sync specs.

Hey there,
the GUI`s I can remember are:
- Diamond GOS 1, 2 and 3 (Reevesoft/Alan reeve)
- G.O.S. 1 and 2 (Total control systems/...)
- G.O.E. 1 and 2 (Total Control Systems/...)
- S.A.M. (Raindorfsoft/Power per Post)
- some PD desktops, like TOS-XL and others.

All of them are just "playable tools" with not much further usable
applications. At least Diamond arrived on cart (version 2 & 3) and
provided some applications, SAM arrived on disk (works with DOS 2.5 and
medium/dual density only !!) and provided many further apps.
Would have been cool, if a GUI was done, that works with (almost) any
DOS, any density and supported many apps... (plus the ability to create
these, maybe via a creator program or a usable program area for such
tools/apps). The way these GUI`s appeared is just too limited in my
eyes, so they are merely something to play around with, rather than
something to use regularly... This may would have been different, if
Atari had chosen to take over one of these GUI`s and sell them as
official Atari software... (there were plans, but you know Atari...)
greetings - Andreas

P.S.: In my mind, these GUI`s show the possibility of a usable desktop
on the A8, but they are far away from GEOS, far far away...

Hey there,
difficulties with the Sparta-DOS version number ?!? Take the programs
"Faker.Com" and/or "Setver.COM", coded by Robert Verdaasdonk/the Fox-1
in the Netherlands. You can find these tools on his homepage or
somewhere around the net. What they do ?!? They just fool Sparta or its
apps. and make them think to use the correct version number... good
docs included !! greetings - Andreas

Sorry,
no screen shots, but I have the full PD type in-listing here on a Pd disk. I can send you this disk as an image, if you wish (and the other GUI`s also). Before SAM (I hope you refer to the GUI, not to Software Automatic Mouth) appeared as a comercial program, there has also been a PD type-in listing. thats just what I have and provide for free...

(And by the way, there is not much difference between the type-in listing and the commercial version; the listing appeared in several Atari magazines and on several Lazy Finger program disks, whereas the commercial version had it all on one disk; I just collected all type-in listings and put them together to one working version, thats very similar to the commercial one.)

greetings - Andreas

P.S.: E-Mail me, if you wanna have SAM and/or the other GUI`s !!
(I can send them as ATR, XFD or DCM images);

>
> --
> ...
Hello Peter,
of course, as an atari fanatic, I have heard of Turbo Basic XL, version 1.5 (from GERMAN programmer Frank Ostrowski). It contains all statements that Atari Basic uses, thus its almost fully compatible. But: it is not built-in, so you always have to boot it from disk or Romdisk/Ramdisk; the standard version is PAL (50Hz) and uses Ram under the OS ROM;

I believe, Jessica is a beginner and thus wants to learn and use Atari Basic first. Besides she comes from America, NTSC (60Hz) country, and maybe she does not (want to) know, there`s also a patched version for Sparta avaiable... Well, Turbo-2000 ?!? Sounds rather like a polish A8 floppy drive, than a new(er) Turbo-Basic language... greetings - Andreas

>
> Richard
> --
Hello Richard,
I believe there are some professionals out there, who can do such upgrades if you a) already have/own that upgrade and b) spend some money for installing it. Unfortunately, I am not such a profi, sorry !! To install a Ramdisk, you should know, that there are many different kinds of A8 Ramdisks, some XE compatible, some partially compatible, some not compatible at all. You have to choose, which one you would like to have (depending on which programs you would like to run) and should not wonder at all, that there are some programs that use extended Ram, but do not work on your RD. Thats Atari Life !!

A SID upgrade is - believe me - no joke !! The polish programmers (the most active guys in the world) did not only develop a Covox upgrade (Digi-sample upgrade, to support true 8-Bit digital Sample sound, like MOD, WAV and other digi-sounds), they also developped a SID-Atari upgrade. Yes, they have installed the SID chip into their Atari computer and there are even a few programs that support this.

(For the Covox upgrade I have seen the schematics, somewhere at a polish homepage, maybe Tight or Taquart and actually own some programs, like MOD players and editors that support Covox; for the SID upgrade I have not yet seen any schematics and only know the System-Info/SI 2.x to exist, that can detect such an upgrade...)

Hello Richard,
unfortunately, ABBUC (Atari Bit Byters User Club) does not provide any Happy enhancements. Therefore they have Speedy 1050 upgrades avaiable, however, these great little things tend to work properly only on PAL systems... greetings - Andreas

P.S.: Maybe you should take a look at the ABBUC "Kleinanzeigen" or "Inserate"; from time to time they have second hand Happy`s avaiable there...

Well,
the CX-85 is whether styled like an XL nor like an XE. It is rather
likely styled like an old Atari 800. therefore they have once been
produced: the good old 800 and bookkeeper (plus other apps.)

You could just poke the values into the mem addresses that hold the version numbers. But this could be a problem, even if you used one of these to tools or changed the version number by poking the values in memory, my programs would still report errors.

Depending on the SpartaDOS version being used. Some CIO calls return different values in SpartaDOS 3 and X and will confuse the routines. So, changing the version numbers will not fix that, only a reprogramming will.

New versions of the programs are online now. You may find them at:

http://www.celebritybase.net/atari8/

Well, believe it or not, just after posting that request, someone
advertised some Atari kit, and lurking in there was a 256K XL with
Stereo... turns out it's two machines - one 256K XL with other tweaks
(not sure what, yet), and the other is an XL with stereo and 16-bit PIA
(dual PIA) - I have no idea what this does, but it apparently has a
hardware speech synth that goes with the upgrade!

So, I have acquired both XLs (one is painted red, the other blue), and
hope to have a very nice system set up! I guess the only thing now is to
make a stereo 320XE, and get a 1200XL, convert to PAL, and get PBI,
256K, stereo, 16-bit PIA, internal basic (or an uprated OS) - and see if
the thing works after all that! *laughs*

Richard, who also may end up with a 520STe for a fiver... but I need an
ST mouse. And I just found a 1351 for my 128, too! Why am I always
hunting mice. I must be a cat...

4137. Needing help with an Atari 1040ST pc??

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-04 00:00:00 UTC
From: CJ <cjlink@mindspring.com>
Message-ID: <8jt83aoja2@slb3.atl.mindspring.net>
Source record: 43604

To all,

I have just recently acquired an Atari 1040ST pc and I am in need of some advise. First of all, does the system require an OS or DOS 3 1/2 disk in order to boot the system. Currently if I power on the system then it checks the disk drive for an disk and displays a white screen on the monitor. If I am in need of a boot disk, where might I obtain a boot disk for an old Atari 1040ST?
Are there any kind of system tests that I may perform on the system?

Thank you for your help, I really appreciate any advise or assistance.

4138. Power Supply for Micronet

Newsgroup: comp.sys.atari.8bit

Does anyone know the specs. for the power supply
for a MPP MicroNet? I picked one up recently but
it came without a power supply or documentation.
Any help would be appreciated.

Thanks,
Boyd Staley

4139. 7800 Cartige info request

Yes, they have the game on. :)

Richard, being evil...

(Some 7800 games have the Pokey chip in them, too)

Theoriticaly you don't need any disk to boot up ST and when you turn it
on without disk you should see a desktop after a while. Theoriticaly
becouse it seems there is a bug in the system which cause you have to
put a disk into drive. It can be empty but must be in DD format (may be
HD but with DD format).

Theoretically you needn't any disk. After turning on the ST you should
see its desktop (green screen with two disk icons and thrash icon).
Theoretically, becouse it seems there is a bug in its OS which cause
that you have to have any DD formatted disk in the drive (may be empty).

There is an Atari ST newsgroup you should try for info. Basically the OS looks for a boot floppy to do stuff like set up the desktop. If you just wait for a really long time, turn on the computer and go eat a sandwich or something, it should give up on the floppy and boot to the desktop. If it doesn't you may have a busted ST.

The OS is in ROM inside the machine.

>Currently if I power on the system then it checks
> the disk drive for an disk and displays a white screen on the monitor.

This is normal. The OS is looking for an .inf (I think) file that contains
desktop information. It contains colors, resolution, and icon placement for
the desktop.

>If I am in need of a boot disk, where might I obtain a boot disk for an old
Atari
> 1040ST?

Let her boot. Insert a 720K floppy (not hi density 1.44Meg). Adjust your
desktop by dragging icons and changing the resolution via the menu bar, and
select 'Save the desktop' (or something like that) from a drop down menu.

> Are there any kind of system tests that I may perform on the system?
To do port tests, you need loop back cables. Its easier to :

1) connect an epson compatable printer (to test the printer port)
2) Connect a modem to test the serial port
3) Read a floppy directory to test the drive.

They're pretty robust, if it booted, you're pretty much there.

> advise. First of all, does the system require an OS or DOS 3 1/2 disk
It isn't a PC so does not need DOS. Very early STs booted their OS (TOS) off of a floppy but most have it in ROM and ought to boot up quite happily on their own. If yours doesn't boot to the desktop in 5 seconds or less then I'd be inclined to think it is faulty.

The numbers stated are simple Atari's internal part number. The chips
themselves are 27C16 or equilavent PROMS (16K per ROM).

ST's strange be a strange beat, but I love them.

The great thing about the ST first of all is, unlike the PC or Mac the
system or OS is in ROM. In the Macintosh this is partially true, and the PC is
all software.

The ST will try to access the drive for a bit, some it seems like longer
than others and eventually give up and look at the OS. The best way to speed
things up I have found is to keep a disk in there. That way it finds a disk,
realizes it won't do anything useful, and moves on.

The ST is great. If you can get that computer expanded to 4 meg, you'll
have a machine that can run the 800xl dj Atari 8-bit virtual drive program to
be used with the SIO2PC cable.

A want list you might want to start looking for:

4 meg upgrade.
ICD Link II cable (or other SCSI drive interface) to use with ASCI port.
External SCSI drive.

Then after than get with Steve Tucker and pick up the SIO2PC cable and run
up to eight quad formatted drives at once for your Atari 400/800/XL/XE
computer. ;)

Take care, talk soon!

In article <39609059.DB9A2ED0@mail.uni-mainz.de>, Andreas Magenheimer <

The Commodore 64/128 browser may run on C64 hardware, but - it aint a web browser on a 6502.

To use Wave you need a $300 CPU upgrade (SuperCPU, a 20MHz 65C816), and a 1Mb RAM upgrade from the same firm.

I'm not really that impressed ;) Or, as about as impressed as I would be if someone said there was a browser for the Apple IIgs running GS/OS 6.01.

Richard

Subject: 1.1) What is an Atari 8-bit computer?

400 800 1200XL 600XL 800XL 65XE 130XE 800XE XE Game System

Here is a very condensed history of Atari, centered around their 8-bit computers.

1972
Atari Inc. is formed by Nolan Bushnell, incorporated on Tuesday, June 27. Atari created the first coin-operated arcade video game with the introduction of Pong. The video game industry was launched and has shaped pop culture ever since.

1976
Warner Communications acquires Atari Inc.

1977
Atari launches the Video Computer System (VCS), later known as the 2600, giving birth to home video game systems.

1978
In December, Atari announces the Atari 400 and 800 personal computers, using the 6502 microprocessor. The Atari 800 was code-named "Colleen"; the 400, "Candy."

The following are most of the team who originally designed the 400/800.

Paul Krasno - Helped with Trnscendental routines
Bill Wilkinson - Designed Floating Point Scheme
Bob Shepardson - Modified IMP-16 Assembler to accept special syntax tables
Paul invented
Mike Peters - Key punching and operating

1979
The Atari 400 and Atari 800 Home Computers debut at the Winter Consumer Electronics Show (CES) in early January.

Jerry Jessop, mailto:jjessop1@home.com writes:
"The first official small shipment of the 400/800 was on August 29th 1979. These were hand built pilot run units to Sears that needed to be in stock by Sept. 1 so they could be placed in the big fall catalog. The units were placed in the Sears warehouse and then immediatly returned to Atari after the "in stock" requirment had been meet.

The first "real" consumer units were shipped in Nov. of 79 and were 400's to Sears followed very shortly by 800's."

These MOS Technology 6502-based systems run at a clock speed of 1.79 MHz, offering 128 colors displayable simultaneously, up to 320x192 graphics resolution and up to 40x24 text resolution in 8 graphics modes and 6 text modes. Video may be displayed either on a composite video monitor in the case of the 800, or on a standard television for both systems. 4 independent sound voices are available through the audio output of the television or monitor, each with a 3 1/2 octave range, plus there is a built-in speaker for key-click and other programmable sounds. The 800 has a second cartridge port and a full-stroke keyboard, while the 400 has a single cartridge port and a membrane keyboard. Each has 4 serial controller ports and an Atari Serial Input/Output port. Originally, both the 400 and 800 were sold with 8K RAM, but later most 800's were sold with 48K and 400's with 16K. Each includes the 10K Atari Operating System in ROM.

The 800 can be fitted with 1-3 of the following two RAM modules:
CX852 8K RAM module, CX853 16K RAM module
and must be fitted with a ROM module:
CX801 10K ROM, CX801-P 10K ROM for PAL machines

[WHEN WAS THE 400/800 REVISION B OS INTRODUCED????]

1981
November: 400/800's begin shipping with the new GTIA chip in place of CTIA, increasing the palette of simultaneously displayable colors to 256 and adding 3 new graphics modes. CTIA is totally phased out by the end of the year.

Jerry Jessop, mailto:jjessop1@home.com adds:
"The very first proto systems did have the GTIA, but it had some problems and was not released in the consumer version until 1981. The GTIA was completed before the CTIA."

1982
The introduction of the 1200XL in late 1982 marks the single largest advance in the 8-bit Atari system. The 1200XL runs most software and hardware designed for the 800 and 400, but now runs a slightly more advanced 6502C microprocessor, and includes a full 64K RAM. The single cartridge and monitor ports remain, along with 2 controller ports. In addition, the 1200XL includes 4 programmable Function keys and a Help key, built-in diagnostic and graphics demonstration programs, and probably the favorite keyboard of any 8-bit Atari computer. Clicks previously outputted through the built-in speaker are now heard from the television or monitor's speaker. The revised 16K Operating System offers many new features, including an alternate International Character Set.

1983
In 1983 Atari replaced the 1200XL/800/400 line-up with the new 800XL and 600XL. These new machines include most of the features of the 1200XL minus the Function keys and the demo program. But now both the 800XL and 600XL have the Atari BASIC language built-in. In addition, these two systems offer the Parallel Buss Interface (PBI), providing fast parallel access to the heart of the computer. The 800XL contains 64K RAM while the 600XL has 16K RAM.

The 600XL can be expanded from 16K to 64K with the 1064 Atari Memory Module.

1984
Warner Communications sells Consumer Electronics and Home Computer divisions of Atari Inc. to Tramiel Technologies on Monday, July 2.

Atari Corporation is formed by Tramiel Technologies and its products marketed under the Atari brand.

(
Atari Games Corporation is also formed from the former coin-op division and markets coin-op games under the Atari Games brand.

Atari Games Corporation is a developer, marketer, licensor and publisher of coin-operated video games, having created such classics as Pong, Asteroids, Centipede, Missile Command, Gauntlet, Area 51, and San Francisco Rush Extreme Racing. Atari Games Corporation is a brand of Midway Games Inc. (NYSE:MWY). The Atari Games home page is at http://www.atarigames.com.
)

1985
The new Atari Corp. delivered on its promise to advance the 8-bit Atari system by replacing the 800XL/600XL with the new 130XE and 65XE in 1985. The 65XE is nearly identical to the 800XL in features, minus the PBI. The 130XE, however, offers 128K RAM, plus the FREDDY chip, supporting the unique (but rarely used) ability for the 6502C and the ANTIC to independently access RAM banks. In addition, the 130XE replaces the PBI port with the Enhanced Cartridge Interface (ECI), continuing the powerful feature of a fast parallel port. European 65XE's include the ECI port.

Only by the final production run of the 130XE and the European 65XE (when was this???) was the XL/XE OS revised to include a "keyboard test mode" that matched the XE keyboard, and a RAM test that tests the full 128K of RAM.

1987
In a change of marketing strategy, Atari introduced the new XE Game System in 1987. Despite its label, the XEGS is a true 8-bit Atari computer system. It offers the convenience of a detachable keyboard and built-in Missile Command game (hold down Select at startup), while offering 64K RAM and full compatibility with the 65XE.

The 800XE, a 130XE with just 64K, was released at some point in eastern Europe. [WHEN???]

1992
Atari officially dropped all remaining support of their 8-bit computer line on January 1, 1992.

1996
On July 31, 1996, Atari Corp. became a JTS subsidiary. JTS Corp., with headquarters in San Jose, Calif., was founded in 1994 to design, manufacture and supply enhanced-capacity hard disk drives for the notebook and desktop personal computer markets.

1998
On February 23, 1998, JTS sold its Atari Division to HIACXI Corp., a wholly-owned subsidiary of Hasbro Interactive, Inc., which is a subsidiary of Hasbro, Inc., for $5 million in cash.

TODAY
Hasbro is a worldwide leader in the children's and family leisure time and entertainment products and services, including the design, manufacture and marketing of games and toys ranging from traditional to high-tech. Both internationally and in the U.S., its PLAYSKOOL, KENNER, TONKA, ODDZON, SUPER SOAKER, MILTON BRADLEY, PARKER BROTHERS, TIGER, HASBRO INTERACTIVE, MICROPROSE, GALOOB and WIZARDS OF THE COAST brands and products provide the highest quality and most recognizable play experiences in the world.

Hasbro Interactive, Inc. is a global interactive entertainment industry leader, innovating new ways to play and developing, publishing and distributing the highest quality interactive games and lifestyle products for a full range of genres and platforms. A subsidiary of Hasbro, Inc. (NYSE: HAS - news), Hasbro Interactive has offices in the U.S., U.K., Canada, Germany and Australia, and internal development studios in the U.S. and U.K. For further information, visit Hasbro Interactive's Web site at http://www.hasbro-interactive.com.

Atari Interactive, Inc. is a Hasbro affiliate, online at http://www.atari.com/

Atari currently (4/00) markets:
Atari Arcade Hits 1 & 2
Centipede
Frogger
Glover
H.E.D.Z. - Head Extreme Destruction Zone
Missile Command
Nerf ArenaBlast
Pong
Q*Bert
The Next Tetris

Subject: 1.2) What are the some of the performance features of the 8-bit Atari?

Some of this text by mailto:bill@newbreedsoftware.com (Bill Kendrick).

CLOCK SPEED:
NTSC machines: 1.7897725 MHz
PAL machines: 1.773447 MHz

SCREEN REFRESH RATE:
59.94 times per second (Hz) on NTSC Ataris
49.86 Hz on PAL machines

ANTIC AND THE DISPLAY LIST:

* 1 Hue; 2 Luminances
** 1 Hue; 16 Luminances
*** 16 Hues; 1 Luminance
+ require the GTIA chip. 1979-1981 400/800's shipped with CTIA
++ Not available via the BASIC GRAPHICS command in 400/800's.
```

GRAPHICS INDIRECTION (COLOR REGISTERS AND CHARACTER SETS):
Nine color registers are available. Each color register holds any of 16 luminances x 16 hues = 256 colors. (Four registers are for player-missile graphics.

Character sets of 128 8x8 characters, each with a normal and an inverse video incarnation, are totally redefinable.

PLAYER-MISSILE GRAPHICS:
Four 8-bit wide, 128 or 256 byte high single color players, and four 2-bit wide, 128 or 256 byte high single color missiles are available. A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to XOR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection.

DISPLAY LIST INTERRUPTS (DLI's):
Screen modes can be mixed (by lines) down the screen using the Display List - a program which is executed by the ANTIC graphics chip every screen refresh:

All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via DLI's.

SCROLLING:
Fine scrolling (both vertical and horizontal) can be enabled on any

line on the screen.

SOUND:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution,
8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4)
can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only
modes can be enabled for digitally sampled sound replay.

A fifth "voice" is produced by the internal speaker on Atari 400/800's
(for keyclick and buzzer) and in the XL's and XE's this was
(fortunately!) rerouted through the normal audio output, and the
keyclick can be disabled.

Subject: 1.3) What is the internal layout of the 8-bit Atari?

The following four paragraphs were written by Chris Crawford and appear in De
Re Atari (Atari#APX-90008), a book published and copyright by Atari, Inc.,
1981-1982. The text been very slightly modified here for generality.

"The internal layout of the Atari 8-bit computer is very different
from other systems. It of course has a microprocessor (a 6502), RAM,
ROM, and a (PIA). However, it also has three special-purpose (LSI) chips
known as ANTIC, GTIA, and POKEY. These chips were designed by Atari
engineers primarily to take much of the burden of housekeeping off of the
6502, thereby freeing the 6502 to concentrate on computations. While
they were at it, they designed a great deal of power into these chips.
Each of these chips is almost as big (in terms of silicon area) as a
6502, so the three of them together provide a tremendous amount of
power. Mastering the Atari 8-bit computers is primarily a matter of
mastering these three chips.

ANTIC ("Alpha-Numeric Television Interface Circuit") is a microprocessor
dedicated to the television display. It is a true microprocessor; it has an
instruction set, a program (called the display list), and data. The display
list and the display data are written into RAM by the 6502. ANTIC retrieves
this information from RAM using direct memory access (DMA). It processes the
higher level instructions in the display list and translates these instructions
into a real-time stream of simple instructions to GTIA.

CTIA ("Color Television Interface Adapter") / GTIA ("George's Television
Interface Adapter") is a television interface chip. ANTIC directly controls
most of GTIA's operations, but the 6502 can be programmed to intercede and
control some or all of GTIA's functions. GTIA converts the digital
commands from ANTIC (or the 6502) into the signal that goes to the
television. GTIA also adds some factors of its own, such as color
values, player-missile graphics, and collision detection.

POKEY (means "POT and KEY" as in the paddles and keyboard) is a digital
input/output (I/O) chip. It handles such disparate tasks as the serial I/O
bus, audio generation, keyboard scan, and random number generation. It also
digitizes the resistive paddle inputs and controls maskable interrupt (IRQ)

requests from peripherals.

All four of these LSI chips function simultaneously. Careful separation of their functions in the design phase has minimized conflicts between the chips. The only hardware level conflict between any two chips in the system occurs when ANTIC needs to use the address and data buses to fetch its display information. To do this, it halts the 6502 and takes control of the buses."

While the 400/800 models contain a generic 6502 CPU, all of the XL/XE models contain Atari's customized 6502C chip. Alan Manuel K. Gloria, mailto:mani@pworld.net.ph writes:

The difference goes something like this: On the Atari, there are two microprocessors, ANTIC and the 6502 or 6502c. To allow them to coexist, ANTIC must shut off the 6502/6502c, a process called DMA. The 6502 supports DMA, but in Atari's implementation, it required 4 chips. The 6502c has this additional circuitry built-in.

More on this from James Bradford, mailto:sup8pdct@mail.cth.com.au :
The 6502c in all PAL atari's, late 400/800, XL, XE NTSC atari's have a special 6502. This 6502 has an extra line called HALT. It is controlled by ANTIC which it uses whenever it needs the data/address bus. The HALT line is on pin 35 of the atari 6502 and must be pulled high for the chip to work (I think) . Early 400/800 NTSC atari's used a standard 6502 and a couple of chips to stop the processor when antic needed the busses

The 130XE and XEGS contain a small additional LSI called FREDDY, a RAM address multiplexer. According to mailto:sup8pdct@mail.cth.com.au (James Bradford), "FREDDY is a type of memory controller. It takes the address and clock from the CPU and multiplexes it with the appropriate timings and signals to use DYNAMIC memory. FREDDY also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a FREDDY but it doesn't have the extended RAM. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16-pin chip (Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from FREDDY, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS goes to. A14 and A15 then go to FREDDY for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say FREDDY does the bank switching is beyond me. An 800XL can look like a 130XE with that 16-pin chip installed (That's right NO FREDDY) and an extra 8 RAM chips."

And more recently James Bradford has written:
Freddy is just a memory decoder and timer. It replaces several chips in the 800xl The small chip near freddy does all the bank selection. CO25953. One line from freddy , Ras (or is it cas?) goes to this chip, Halt and the bank /processor select lines go into this same chip and ras (cas?) comes out. a pin for each bank. If i remember correctly, refresh also goes into this small chip. It would be quite easy to make an 800xl work just like a 130xe with this chip

since Ras (Cas?) is required by ALL dynamic ram.

Some words on GTIA bugs, from Andreas Magenheimer,
mailto:magea000@mail.uni-mainz.de :

All of these newer and buggy GTIA`s were built with the "eastern european" XE computers. they were made in China. Although Atari knew about this, they did not change them. so you have to replace them with older XL/XE GTIA chips...

But one more thing to GTIA and Antic chips: All PAL versions of these chips have a color bug, since gr. 11 produces 16 colors, but merely 15 different colors (one color: brown at the beginning and end of the palette is absolutely the same; normally there should be a red tone here !); with gr. 9 you will see 16 shades, but merely 15 different shades (the same as gr. 11, one shade is doubled!).

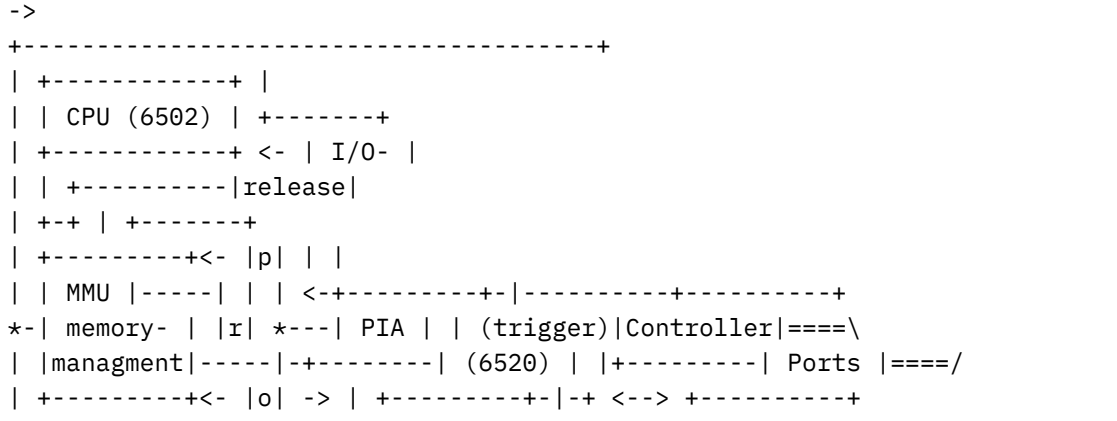
Strange enough, I also found this color bug to appear in PAL Antic chips, there is also the red tone missing (and the brown one doubled !). This color bug appears in all PAL Antic and especially GTIA chips. Atari never fixed it, so you find it inside any GTIA equipped PAL Atari 800 and also the later XL and XE models. Since PAL users have to live with this bug, they sometimes do programs which look absolutely strange on NTSC and vice versa (not to mention the different Herz frame 50/60 hz and higher PAL line resolution/overscan).

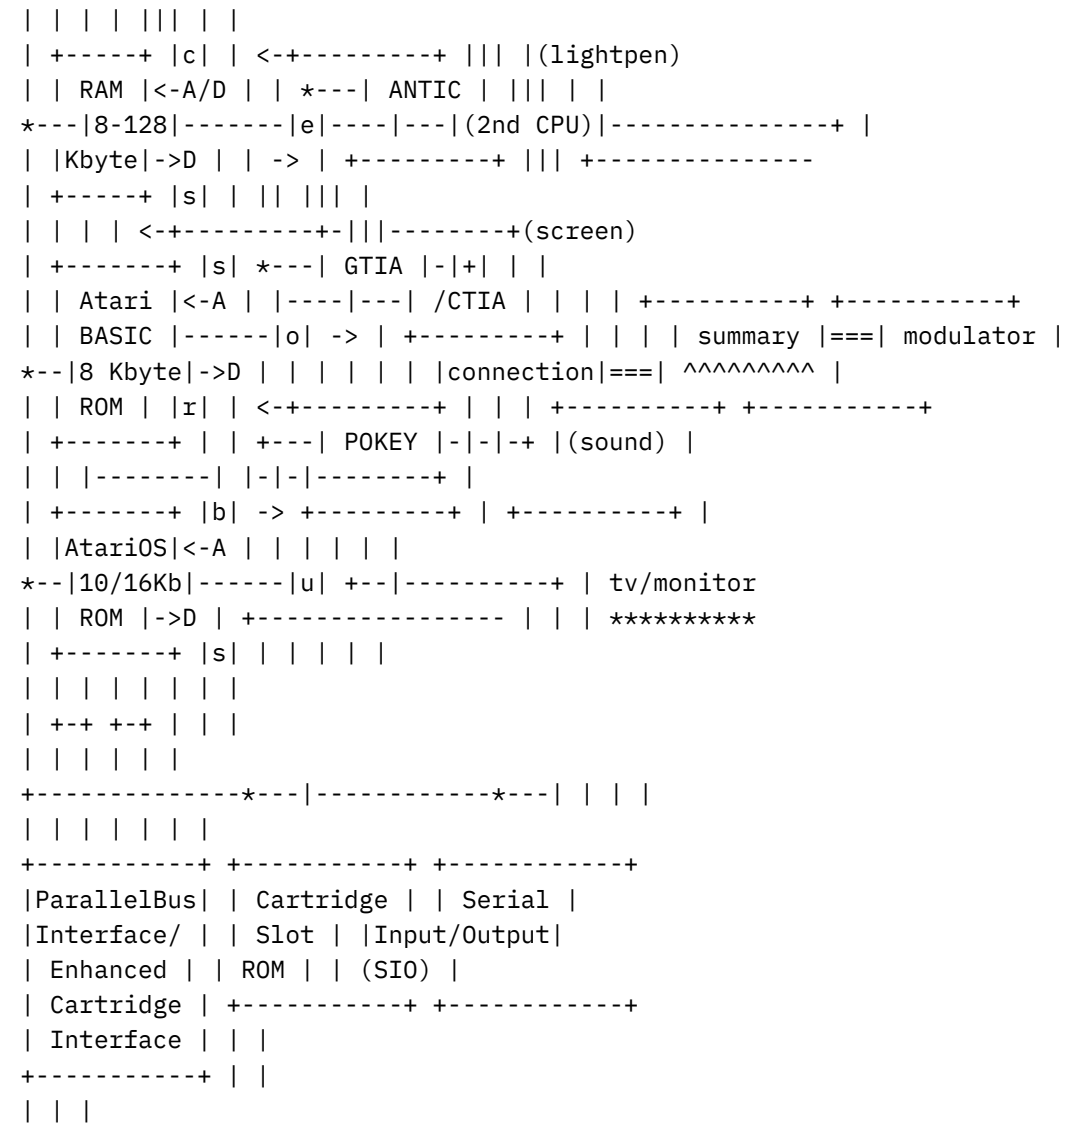
Imagine the following: a PAL GTIA has 15 colors in gr. 11
a NTSC GTIA has 16 colors in gr. 11
a PAL GTIA has 15 shades in gr. 9
a NTSC GTIA has 16 shades in gr. 9

Thus, a combination of gr. 9 and 11 gives:
16x16 = 256 colors on NTSC
15x15 = 225 colors on PAL

And - as said before, the bug seems also to appear with Antic...
Bad luck, we PAL users... Greets - Andreas Magenheimer.

Hardware Arrangement (With thanks to mailto:twh@bigfoot.de (Thomas Havemeister))





- memory expansion -cartridge with - disk drive
- Z80 card programs - printer
- 80 char card (games , dos) - modem

NOTES
* RAM: 400/800: 8K, 16K or 48K standard
600XL:16K standard
1200XL/800XL/65XE/800XE/XEGS: 64K standard
130XE:128K standard
* ROM: 400/800:10K OS, 1200XL:16K OS, all others:16K OS + 8K Atari BASIC
* CPU: 400/800:6502, all others:6502C
* 800 includes two Cartridge Slots, all others include one
* early release 400/800 have CTIA instead of GTIA
* 400/800 have 4 Controller Ports, all others have 2
* PBI is on 600XL/800XL only
* ECI is on 130XE/800XE/European 65XE only

Technical data and schematics for the Antic, GTIA, and POKEY chips are
available on Curt Vendel's web site, thanks to permission from Hasbro's

Atari Interactive Divisions release of this data. See:
http://www.atari-history.com/articles.html

Subject: 1.4) How did Atari get it's name?

Graham Thornton, mailto:dangermouse@prodigy.nospam.net types:

This article was published in "I/O - The Magazine of the Atari Home Computer Club" in issue 3 - Summer 1983. The magazine was the official mouthpiece of Atari UK. The article was not attributed to any one person. The words are thiers, not mine.

How Atari Got It's Name

The name Atari actually comes from Japan. And yet the company is most definitely American. Every wondered why? It's an interesting story and one well worth telling.

In 1972 three friends decided to invent and market the first commercially feasible video game. They were Nolan Bushnell, Ted Dabney and Larry Bryan.

To become a partner each man had to submit $100 to the project - a remarkably small sum when you consider the company's success! The next step was to find a name.

Drinking beer and thumbing through the dictionary one day, the three friends came across an interesting entry under "S". The word was Syzygy, or "the straight-line configuration between three celestial bodies". What a perfect name they thought, for three such astronomically talented people!

Now they could get on with the business of inventing games. Their first, Computer Space, was produced and all seemed to be going well.

But then things started to get a little shaky. Larry Bryan decided not to ante up his $100 and pulled out, leaving Bushnell and Dabney to go it alone.

The set up a shop in Santa Clara, California, and incorporated the business. A little later they invented Pong(r).

Busnell and Dabney applied for the name Syzygy to the Office of the California Secretary of State, which regulates Californian corporations, but were told that they were too late. The name was already taken.

Following unsuccessful attempts to buy the rights to the name from the first Syzygy corporation, which appeared to be inactive, the friends' solicitor pressed them to think up an alternative.

This proved difficult. BD Inc and DB Inc were tested and then rejected in turn: the first bore too close a resemblance to Black & Decker, the second to Dunn and Bradstreet.

Inspiration occurred at last, once again in an informal atmosphere. Bushnell and Dabney were both keen players of Go, a Japanese strategy game, and their best brainstorming always occurred over a good game and a bottle of beer.

This time, they decided to make a list of several Go words to see if one of them would fly as the new corporate name.

First choice was "Sente", which means "the upper hand" - something that greatly appealed. Second and third choices were "Atari", which has a similar meaning to the English word "check", and "Hanne", an acknowledgement of an over-taking move.

Busnell and Dabney submitted the list once again to the Office of the Californian Secretary of State, which approved "Atari". The rest is history.

When the company name changed, Bushnell and Dabney decided to update the logo too. They incorporated the "S" from Syzygy and the "A" from Atari into the new design.

It was not until later, as the company became increasingly successful, that an advertising agency designed the slicker and now famous Atari logo - the "fuji" or stylised "A" design.

Subject: 5.1) What is the National Capital FreeNet Atari Users SIG?

Internet access to the National Capital FreeNet (Ottawa, Ontario, Canada):

telnet://telnet.ncf.carleton.ca (Type "go atari" at any menu) or
gopher://gopher.ncf.carleton.ca or
http://www.ncf.carleton.ca/

Contact:
mailto:ac382@freenet.carleton.ca (Jack Kitowicz) or
mailto:aa728@freenet.carleton.ca (Blair Dea)

Subject: 5.2) What is the Closer to Home BBS?

A BBS running BBS Express! Pro by Video 61 for the 8-bit Atari, available on the Internet via telnet! Running in an 8-bit Atari emulator for Windows 95.

telnet://cth.tzo.com/

Sysop: Tom Hunt, mailto:tomhunt@bright.net

Subject: 6.1) What is FidoNet?

[We're not quite sure of the source of the following two paragraphs, but they may have been orginally written by Alan Sharkis.]

FidoNet is a system not unlike the Internet in that it consists of BBSs linked together. Each discussion group (there are nearly a thousand) may or may not be carried by an individual BBS as the sysop chooses. Discussion groups are called echoes, and each echo must be moderated. There is an Atari National Echo which is 8-bit, and several (I believe) ST echoes. BBSs are also free to have local discussion groups that may or may not be echoed nationally.

To access FidoNet, you need to find a FidoNet BBS that carries the echo or echoes you wish to read, and then abide by the rules of both that BBS and the echo. Some of these BBSs require annual membership fees. Some are supported by voluntary donations. One such that can also be reached by telnet is Doc's Place BBS. I'm not even sure of its location, but I think it's Clearwater, FL. If you're coming in via an ordinary ISP and either Netscape or IE, you simply type:

telnet://bbs.docsplace.org

mailto:krap@zwieracz.ideefixe.nom.pl (maciej grzeszczuk) adds:

all fidonet backbone echoes are carried by zwieracz.ideefixe.nom.pl, and they are available read-only via any newsreader. zwieracz itself (2:480/70, 2:48/70, 2:48/700, 2:2/3009) is the main polish fidonet-internet gateway. i gateway many usenet groups onto fidonet echoamil bidirectionally, so fidonet users here in poland can easily read and post articles. this group is also available at my system via EMSI over TCP or standard modem dial-up connection (emsi over tcp ports are 60177 - for telnet, and 60179 for raw socket).

try url: news://zwieracz.ideefixe.nom.pl/fido.atari and you'll reach national ATARI group.

Subject: 8.1) What IRC channels discuss the 8-bit Atari?

==> #atari8 - Just for 8-bit Atari users!

Paul Clark offers this tip:

I think Dalnet carries #atari8, do the following;

telnet://telnet.dal.net

At the login prompt, type;

dalnet

If prompted for a password, just hit enter. You should
be able to navigate to #atari8 from there.....

==> #rgvc - Classic Games and Systems Collectors. "Rec.Games.Video.Classic"

mailto:cmwagner@gate.net (Chad Wagner) writes:

If you have access to a Unix host then you should be able to get to irc by typing irc at your shell prompt and jumping on an EFnet server (irc.portal.com, irc.eskimo.com, dewey.cc.utexas.edu) and joining #atari8.

If you are using a host that has a menu system then locate IRC and go there,
and join #atari8 (and hope your on EFnet, :).

Another that carries #atari8 is ssilicon.w1zard.net run by Jon Melbo.

If you are using SLIP/PPP then download a client (for Windows users, download
mIRC for Winsock archives, and I would guess that most SLIP/PPP users -- if
they have gotten that far -- are familiar with IRC, :) and select one of
the servers and join #atari8. There is many IRC servers on EFnet, chances
are the one your on is on EFnet.

Subject: 9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into
100% printable ASCII characters, so that the file may be posted or e-mailed
anywhere a text message can go. The 8-bit Atari is perfectly capable of
UUEncoding/UUdecoding as well. On the archives:

Uudecode 1.2a by John Sangster - very functional.
filenames: Archivers/uudecode.bas, Archivers/uudecode.doc

Yet Another UU-coder by John Dunning - both decoding/encoding.
filename: Archivers/yau.arc

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use."
filename: Utilities/uue.arc

Dumas UU-coder by John Dunning
filename: Cc65/dumasuu.arc

Subject: 9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The archives contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended.
filenames: Archivers/superarc.arc - both Super Un-Arc & Super Arc
Archivers/suprarc2.arc - Super Arc
Archivers/supunarc.com - Super Un-Arc
Archivers/supunarc.uue - Super Un-Arc

Subject: 9.3) What are the .DCM, .ATR, and .XFD file formats?

These are all filename extensions used to name files containing entire 8-bit
Atari floppy disk images.

DCM - Disk Communicator format. Invented by Bob Puff,
mailto:audioguy@cheerful.com for his Disk Communicator 3.2 utility.

Used when working with native Atari hardware.
DCM specs at: http://home.planet.nl/~ernest/diskcomm.zip

ATR - Atari disk image format. Invented by Nick Kennedy,
mailto:nkennedy@cswnet.com for his SIO2PC project.
Used when working with non-Atari hardware.

XFD - Xformer disk image format. Invented by Emulators Inc,
mailto:emulators@msn.com for their ST Xformer emulator.
Identical to ATR except without the 16 byte header.
Used when working with non-Atari hardware.

PRO - APE ProSystem format. Invented by Steven Tucker,
mailto:classics@nacs.net for his APE ProSystem device.
Used with APE, the Atari Peripheral Emulator.

Subject: 9.4) What are the .XMO and .BIN file formats?

XMO stands for XMODEM. The idea was that the file was not plain text,
but was a binary file. As a binary file, it had to be downloaded using a
file transfer protocol such as XMODEM. The use of ".xmo" as a filename
extender was popular once, but has been discouraged for years.

BIN - another filename extension sometimes used to designate binary-load
files. Like .xmo, use of .bin is discouraged.

Subject: 9.5) How can I make my commercial boot disk (tape, cart) into a load
file or disk image?

Russ Gilbert, mailto:russg@en.com writes:

The disk image part is a matter of taking a copyable boot
disk and making an atr, xfd, dcm or other disk image type
file out of it, usually for use with an emulator. Before
emulators, the Bob Puff .dcm format was used to
store/archive/retrieve boot disk images.

Almost all commercial software for the A8 is/was copy
protected. For boot disks, this usually involved a large
number of special formatting that couldn't be copied using
ordinary sector copiers. Usually the boot process involved
checking to see if a certain sector error occurred, then
proceeding. If the error did not occur, the disk was a copy
and would not work.

For carts, usually the method of protection was to write to
the cart area of memory and see if the value changed. If the
value changed, the cart program was in RAM, not ROM and
would fail to operate.

For tapes, again a fair number of schemes were used. Some varied the speed at which the tape loaded. I'm not familiar with tape protection schemes.

With all software media (cart, tape, disk), there may be program encryption, which must be decrypted before the program can run. This to make more difficult disassembly of the program.

There were/are a number of products to defeat copy protection/allow copying of protected software for the A8. The most common way to defeat copy protection was to disassemble the software and revise sections of code so that the copy protection was defeated. A software with defeated copy protection is called a 'cracked' software. The basic procedure is to understand how cart/tape/disk software initializes, loads and runs. Usually make a file out of the software and 'follow the code', starting with loading of the program, to decryption to the actual running of the program. Today, it is unnecessary to copy original commercial A8 software because it has already been defeated and may be found at a few ftp sites. (Note umich archive has no commercial/non-shareware software.)

Besides 'cracking' software, there were/are hardware devices to copy commercial protected software. The Happy 1050 and the Archiver, and probably other modifications to the 810, or 1050 allowed 'bit image' copying and reproduction of the special formatting that copy protected disks had. Using these archiving disk drives, a copy of the original disk, including all special formatting and the original code is copied, thus making a copy protected copy, not cracked, just like the original.

For carts, copying could involve cracking or again there were/are products to reproduce the cart and simulate a ROM. Or the cart might be copied and burned on the correct type of eprom, to make a plug in cart. 'The Impersonator', the 'Pill' are two cart copy schemes copy the cart to a file, then don't change the code, but use a 'dummy cart' to fool the software into thinking there is a ROM present.

Basic tools for copying, then cracking, carts and disks are a sector editor and disassembler. Carts are usually most easily dumped using a special OS, like Omnimon, to interrupt the cart and dump memory to disk. There are a few pd cart copiers that have the user plug the cart in when the program is running, I don't believe these pd cart copiers are very good or very wise to use.

So, the basic answer to 'how do I make a copy of my copy protected commercial software' is don't bother. Find it on the net.

There is one exception, in that this 'solution' involves a
minimum of effort and is relatively safe. I refer to
'Chipmunk' and 'Black Patch' software to make cracked boot
disk copy of commercial disks. HOWEVER, even if you use
these two commercial archival tools, be sure you write
protect your originals, and be careful not to accidentally
write to the original disk.

Finally, I'll mention a very modern (I mean 1997) product.
The APE Pro system, by Steven Tucker, in the registered
version of this shareware allows making disk images called
'Pro' images. APE (Atari Peripheral Emulator) requires a
cable, called the SIO2PC cable, that connects the A8 13 pin
serial port to a serial port on the IBM PC clone. To make
'Pro' images, a special adapter cable is needed, not just
the 'standard' SIO2PC cable. The 'Pro' image can 'capture'
the copy protection of an original commercial disk. The
'Pro' image can then be loaded into an A8 using the APE
registered version software, thus backing up your original
disk software. Note the 'Pro' image will only be of use to
person(s) owning registered APE software and 'Pro' adapter
cable.

Subject: 9.6) How can I convert my commercial boot tape into a cassette
image file?

mailto:ernest@wxs.nl (Ernest R. Schreurs) writes:

For those of you that like ALL classic Atari software, there is now a
way to store all software that has been recorded on cassette tapes on
the hard disk of your PC. I have written a program that is similar to
the SIO2PC utility written by Nick Kennedy. But this one is intended
for use with cassette software. You will need the following items:

Any PC equipped with a sound card and about 50 to 100 Megs of free
disk space to work with. The sound card should be able to sample sound
at a sample rate of 44.100 Hz mono. The sample must be recorded into
a .wav file.
You need the wav2cas program to convert the .wav file to a .cas file.
The .cas file is a digital cassette image file that only contains the
data that is on the cassette tape. Once you have that, you can throw
away the .wav file. The .cas files are typically 16 to 64K, so they
are relatively small.

To load cassette files into your Atari (i.e. boot a digital cassette
image) you do not need a sound card. You do need a SIO2PC cable or
similar device. You also need the cas2sio program.

The wav2cas and cas2sio programs should be available from the archives
of Umich by now. They have been put together in one zip file
wav2cas.zip, along with the documentation and the 'C' source code.
You can download it through the web interface at the URL

http://www.umich.edu/~archive/atari/8bit/Emulators/Peripherals/wav2cas.zip
Note the capital in Emulators and in Peripherals.
Thanks to William Kendrick for helping me get it uploaded there!
You can also try the gopher stuff:
gopher://gopher.archive.umich.edu:7055/11/atari/8bit/Emulators/Peripherals/

Steven Tucker, the author of APE, has added support for this file format as of version 1.15 of APE. It looks real neat, so try that out too! Thanks to Steven for adding a nice user interface for these cassette images. He did a nice job. I am hoping other using are willing to write some programs to get more enjoyment out of this underrated storage medium.

My stuff is available totally free for personal use, so I hope you enjoy it. Read the docs about the conditions.

Keep those XL's/XE's humming.
If you have any questions feel free to E-mail me: mailto:ernest@wxs.nl

---

Subject: 10.1) What kinds of monitors can I use with my Atari?

In general, you either need a Composite Video monitor, or a standard TV.

Television:
You'll need a video cable (not detachable on the 400/800), and a TV Switch Box. Used with VHF Channel 2 or 3.

Monitor:
The 8-bit Atari produces a color Composite Video signal, plus separate chroma (color) and luminance (brightness) signals which the best composite video monitors can take advantage of. Popular examples of such monitors include the family of monitors produced by Commodore.

Gotcha's:

-the 400 and North American 600XL lack a monitor port entirely. They can only be used with a TV.

-the XE Game System provides an RCA-style jack in place of the Monitor port; so it provides Composite Video but lacks separate chroma\luma signals

-the 600XL, 800XL and 1200XL lack separate chroma signal (can be added via hardware modification)

-the XEP80 Interface Module produces a monochrome Composite Video signal via an RCA-style jack. This higher-resolution signal produces crisp, clear 80 column text on 80-column monochrome composite video monitors.

The pinout of the Monitor port is in the pinout section of this FAQ list. The monitor connector on the back of the Atari can be utilized using a 4-pin DIN to RCA converter. You don't need to build a separate cable.

mailto:buesch@srv.net (Brent Buescher, Jr.) writes:

"The best monitor for an Atari 8 bit that is readily available today would be a television with an S-video input---these tend to be large and high-quality, so the s-video input is the deciding factor there. You'll have to build the cable yourself, and if you have an XL you'll want to do the Super Video upgrade that Ben Poehland published in Atari Classics a few years ago---this puts the chroma signal back on the pin that it should be and cleans up the video signal enormously. It's really more of a fix than an upgrade.

I use a commodore split-video monitor. They work great and are cheap-to-reasonable when you can find them."

mailto:bryede@emi.net (Bryan Edewaard) writes:

"Yes, the best choices are monitors that support "Separated Video" (sometimes called Commodore video on Commodore monitors), or S-Video. These monitors have separate color and luminance video inputs, which give a sharper picture without cross-color artifacts - such as the colored fringes on text when viewed on a TV (although some games use these artifacts to get additional colors). If you have an XL computer, then it needs an upgrade to support these monitors due to the omission of chroma from the monitor port. the 800 and XE computers don't have this problem.

The 2nd best choice is a TV or monitor that has a "Composite Video" (usually called just "Video" or "Aux") input. This is a signal that has the color and luminance information combined into one signal. The picture will be a little less sharp, but still much better than using the "Channel 3" output.

>Where might I find one?

I've seen them a flea markets, garage sales, swap meets, ham fests, and in newsgroups like this one. Plus, many new TV's support S-Video and Composite video inputs.

>What are the advantages of using one of these rather than a TV?

Well, it's all a matter of how many stages the signal must go through.

1. The Atari generates video as a color signal and a brightness (luminance) signal. These are passed to the monitor port as Chroma and Luma signals (XL's have no Chroma output from the factory).

2. The signals are mixed together to make a standard video signal which is also passed to the monitor port as Composite Video.

3. Then the mixed video signal (along with audio) goes through the process of being "modulated" into a TV radio signal (channel 3 or 4). This step involves removing high frequencies from the video (blurring it) and sending it to the TV in a fragile broadcast form that's suseptable to all kinds of interference. Then the TV must (1) extract the video signal from the radio signal, (2) separate the Chroma and Luma components as best it can, then (3) divide the Chroma in R, G, and B. Any of these steps that you can eliminate will help your picture.

>Are there any other composite video monitors that anyone would recommend
>(and where might I find one)?

Maybe the 8-bit FAQ mentions these monitors. The most common one is
probably the Commodore 1702 which has a very good picture and is quite
reliable.

If you plan to use an XL (which I do), upgrading the video circuitry
makes as big a difference as what monitor you choose. Ben Poehland has
some excellent articles in Atari Classics magazines for improving the
quality of the XL's video, as well as restoring the missing Chroma
output."

Lonnie McClure mailto:lmcclure@ibm.net has the last word on Commodore monitors:

Comodore models: 1701, 1702, 1802, CM-141, 1080, 2002, 1902, 1902A*,
1084**, 1084S**.

* The 1902A used a DIN connector for chroma/luma, which makes cabling a
bit more of a problem. The composite and audio connectors are standard
RCA jacks, however.

** The 1084 and 1084S had more than one version. Some used the a DIN
connector for chroma/luma connections, like the 1902A, while some used
standard RCA jacks.

The 1902 and 1902A are very different in appearance. The original 1902
shares the same slightly rounded front case design as the 1080 and 2002,
while the 1902A is has a rather square case design, and was manufactured
by Magnavox (as were some of the 1084 and 1084S versions).

Jerry Jessop, mailto:jjessop1@home.com explains why French Ataris produce
fewer colors:

"I will tell you why it only has monochrome out, because it's SECAM and a
SECAM GTIA was never produced. The PAL GTIA is used in France and the Lum
outputs are run into an onboard encoder to produce a "psudo" color depending
on the Luminance output, composite only. This is why a SECAM VCS or 800 has
nowhere near the same number of colors (16) availible as a PAL or NTSC unit
(256).

The FGTIA was never completed as the market size did not warrant the expense.
The largest SECAM market is not France but the Soviet Union (former) and in
80-84 sales of these items there were not possible."

Subject: 10.2) What is the difference between NTSC and PAL machines?

Software written for NTSC (North America) will always work on PAL machines,
but software designed on PAL machines (Europe) won't necessarily work on
NTSC machines.

Wayne Booth, mailto:trek@ihgp15.ih.att.com writes:

The differences with PAL and NTSC have to do with the number of lines displayed on the screen and whether they are using 50 or 60 Hertz.

If I remember correctly, I believe PAL has 625 lines/screen and they refresh the screen 50 times a second doing 1/2 the lines each refresh so they effectively repaint the screen 25 times a second. NTSC is 525 lines/screen with a 60 times a second refresh - again only half the lines each refresh so a 30 times a second frame rate. This would change the amount of time available during vertical sync pulse, and the number of lines that need to be redrawn each time.

Graham Thornton, mailto:nero@chicagonet.net adds:

I use both a real PAL Atari 800 and a PAL-ANTIC 1200XL here in the US.

Replacing the ANTIC chip with a PAL version changes the screen refresh rate to 50Hz which allows most of the PAL-only European software to run. Your system will still report itself as a NTSC machine, unless you change the ROM (see the Nir Dary upgrade), but most software doesn't care.

The one problem you might run into is your monitor. Replacing the ANTIC will mean your North-American Atari is now generating an NTSC signal at 50Hz, instead of the usual 60Hz. Some people will tell you that modern TVs and monitors don't care but that isn't actually true. My brand-new Sony Trinitron 15" colour TV/monitor goes bezerk with the upgraded 1200XL, but my 15-year old 10" Texas Instruments color monitor (designed for the TI-99/4A) is fine.

You can also use real European equipment here in North America, provided that you have a PAL-compatible TV/monitor. The frequency of the power system is irrelevant, as I use my 800 with a 110V/60Hz 1050 power supply.

Subject: 10.3) Is the software for the Atari 8-bit computers "TV-standard dependent?"

{some PAL demos flicker, or won't run at all on NTSC machines}

mailto:buesch@srv.net (Brent Buescher, Jr.) writes:

This is because PAL machines have a vertical refresh frequency of 50hz (NTSC use 60hz) which translates into more vertical blanking time for demos and other computation-intensive graphics software. So PAL demos that won't work on NTSC machines are usually returning from a VBI (vertical blanking interrupt) too late. Some also attempt to use more vertical resolution ("longer" display lists) than an NTSC display can handle.

mailto:thor@math.tu-berlin.de (Thomas Richter) adds:

Yes, it is. Mostly because the frequency of the vertical blank interrupt is different (60Hz for NTSC, 50Hz for PAL). The old OS A was not clever enough to notice the difference, so all system timings like the keyboard auto-repeat function depend on the TV system. These parts of the OS have been corrected

with OSB and the XL versions of the OS. However, as most games install a VBI, their timing does still depend on the frequency -> they will run slightly slower for PAL versions.

Another point is that the popular pseudo-colors used in the Antic-F (Graphics 8) mode are not colorful at all when displayed on a PAL TV, because of differences in the color encoding for the TV. The schematics of the Xl computers include however a hack how to change the PAL version to the NTSC version (the PAL versions include two crystals, one with 5/4th of the frequency of the other. One is used for the system clock, the other for the color clock), but I never dared to apply it.

Subject: 10.4) What are the PAL, NTSC and SECAM video broadcast standards?

Here are several links on the topic.

http://www.ee.washington.edu/conselec/CE/kuhn/ntsc/95x4.htm
http://www.alkenmrs.com/video/standards.html
http://www.ee.surrey.ac.uk/Contrib/WorldTV/
http://www3.3dresearch.com/video/Countries2.html
http://www3.3dresearch.com/video/Conversion2.html

Subject: 11.1) What are the best terminal emulators available?

Here are some of the more popular PD/freeware/shareware terminal programs available.

Ice-T XE v2.72 (128K XL/XE) or Ice-T 800 v1.1 (48K)
shareware by Itay Chamiel, mailto:itayc@hotmail.com
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: X/Y/ZMODEM download
Autodial: Yes (2.72) or No (1.1)
Backscroll buffer: Yes--8 screens (2.72) or One screen (1.1)
Capture-to-disk: Yes--up to 16K (2.72) or No (1.1)
Summary: Outstanding flicker-free high-speed VT100 emulation.Recommended!
http://www.cs.huji.ac.il/~itayc

FlickerTerm 80 v.0.51, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus

BobTerm 1.22, shareware by Bob Puff
(There's also a 1.23 that's specific to PC XFormer)
Emulates: VT52

Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; best for BBSing
filename: Telecomm/bterm12.arc

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
filenames: Telecomm/k65v37.arc - latest version
Telecomm/k65doc.arc - documentation
Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Only option combining VT100, XMODEM, Kermit; buggy at file Xfers
filename: Telecomm/omnicom.arc

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Only option for VT100 emulation on the XEP80; 1200bps top speed
filename: Telecomm/vt850b1.arc

Subject: 11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs that allow an MS-DOS system to work with an
Atari-format diskette. The following require a DOS and disk drive on the
Atari end capable of the SS/DD 180K format:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
filename: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
filename: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Use MyUTIL!
filename: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett with Mark Vallevand, and
SpartaDOS disk utility by Mark Vallevand
filename: Diskutils/myutil.zip
includes best version of UTIL for read/write of SS/DD 180K Atari disks,
plus Mark's SpartaDOS disk utility v0.1e to access 180K SpartaDOS disks

MyUTIL and the XF551 - tips from mailto:JTKIRK@urp.edu.pe:

]MyUtil works fine with the XF551. The XF551's speed is 300 rpm (sometimes even
]up to 303 rpm). I've got two XF551s and can read/write disks written on a PC
]with MyUtil on both with no problems. MyUtil even can write to a DS/DD disk,
]for a total of 360 K, BUT: the ATARI disks not only have the bits inverted,
]the second side is also read BACKWARDS respect to PC disks. That is, when
]MyUtil on the PC writes to what it thinks is sector 721, it really is writing
]to sector 1440! Worse, if you take an ATARI disk with a file whose sectors
]get past sector 720, MyUtil will attempt to read the sector 2161-n instead of
]'n', and you'll get a 'truncated record' error. The solution is simply to
]rewrite the code to take into account this (if sec>720 then sec=2161-sec).
]Let me know if you modify this. You don't know how frustrating it is to have
]to use only 180 K of a 360 K disk! I'm going to analyze the source code, but
]I don't know if I will be able to modify it properly. If someone does it
]before, please email me and send me an uuencoded copy or tell me where to get
]it.

Here's some advice on using the above utilities from mailto:hans@umd5.umd.edu
(Hans Breitenlohner):

There are two technical obstacles to interchanging disks between
DD Atari drives and PC drives.

1. The Atari drive spins slightly slower (288 rpm instead of 300 rpm).
If you format a disk on the Atari, then write sectors on the PC, it is
possible that the header of the next physical sector will be overwritten,
making that sector unreadable. (The next physical sector is usually
the current logical sector+2). The solution to this is to format all
disks on the PC.
(Aside: Does anybody know how this problem is handled on the
XF551? Is it also slowed down?)
Konrad Kokoszkiewicz, mailto:draco@mi.com.pl answers:
"The XF551 disk drive is not slowed down - these drives are spinning
300 rotations per minute. To prevent troubles with read/write disks
formatted and written on normal Atari drives (288 rot/min), the main
crystal frequency for the floppy disk controller is 8.333 MHz
(not 8 MHz, as in 1050, for example)."

2. If the PC drive is a 1.2M drive there is the additional problem of the
track width. The following is generally true in the PC world:
- disks written on 360k drives can be read on either drive
- blank disk formatted and written on 1.2M drives can be read on

either kind
- disks written on a 360k drive, and overwritten on a 1.2M drive,
can be read reliably only on a 1.2M drive.
- disks previously formatted on a 360k drive, or formatted as 1.2MB,
and then reformatted on a 1.2M drive to 360k, can be read reliably
only on a 1.2M drive.
(all this assumes you are using DD media, not HD).

Solution: Use a 360k drive if you can. If not, format disks on the
Atari for Atari to PC transfers, format truly blank disks on the PC
for PC to Atari transfers.

Jon D. Melbo, mailto:ssilicon@lax.net sums it up this way:
So a basic rule of themb when sharing 360KB floppies among 360KB &
1.2MB drives is: Never do any writes with a 1.2MB drive to a disk that
has been previously written to in a 360KB drive....UNLESS... you only
plan on ever using that disk in the 1.2Mb drive from then on out. Of
course a disk can be reformated in a particular drive any time for use
in that drive. As long as you follow that rule, you can utilize the
backwards compatible 360KB modes that most 1.2MB drives offer.

While the above work with SS/DD 180K Atari-format disks, the following
combination of utilities can be used to work with SS/SD 90K Atari-format
disks, and is currently the best bet for reading SS/ED 128K Atari-format
disks.

AnaDisk 2.07, shareware by Sydex - Reads/Writes "any" 5.25" diskette
filenames: Xf2/anad207.zip, Xf2/anadisk.txt
Apparently 2.07 is buggy.
Anadisk 2.06 is available at: http://ch.twi.tudelft.nl/~sidney/atari/

Deana by Nate Monson - converts AnaDisk dump files from Atari format
filenames: Xf2/deana.com, Xf2/deana.txt

Explanation --> According to mailto:crow@cs.dartmouth.edu (Preston Crow),
"As best as I can figure it out, if your PC drive happens to read
FM disks (I'm not sure what the criteria for that is), then you
can read single density disks on your PC by dumping the contents
to a file with AnaDisk, and then using Deana.com to convert the
dump file into a usable format.
For enhanced density disks, Anadisk generally only reads the first
portion of each sector, but it demonstrates that it is possible for
a PC drive to read enhanced density disks."

Subject: 11.3) Can I read/write MS-DOS disks on an 8-bit Atari?

a) Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050
drive or equivalent. Very limited.
filenames: Diskutils/mule.arc, Diskutils/mule.exe, Diskutils/mule.txt

b) SIO2PC, described elsewhere in this FAQ List (section 11.5), can be used to read/write to a hard drive connected to an MS-DOS system. This can also be a very effective file-transfer solution.

c) The XF551 3.5" Upgrades from Computer Software Services (see the companion vendor/developer list) allow the Atari XF551 disk drive to read 720K 3.5" MS-DOS disks.

d) The Floppy Board, the add-on to the Black-Box from Computer Software Services (see the companion vendor/developer list), allows both low density (360K 5.25", 720K 3.5"), and, in the case of the Deluxe Version, high density (1.2M 5.25", 1.44M 3.5") external MS-DOS-standard floppy drives to be used on the Atari. A utility is included to read/write MS-DOS formatted floppies in all supported densities.

Subject: 11.4) How do I transfer files using a null modem cable?

This section by mailto:cb541@cleveland.Freenet.Edu (Russ Gilbert)

Q: How do I connect two cmputers using a null modem cable?

A: You need a term program and RS 232 ports on both computers. The RS 232 ports need to be connected together using a 'null modem cable'.

For up to 4800 baud, no flow control lines need be connected. Just cross the transmit and receive lines and join the grounds together. Transmit is pin #2, receive is pin #3 and ground is pin #7 on the 25 pin port. 25 pin #2 goes to Atari #4 (XMT to RCV), 25 pin #3 goes to #3 on Atari (RCV to XMT) and #5 of 850 goes to #7 of 25 pin (GND to GND).

The right hand pin on the 'long' side of a female 'D' connector is #1. There are 13 holes on this 'long' side, 12 holes on the 'short' side. The numbers go to the left 1 to 13 then #14 is under #1 and left again so that #25 is under #13.

Most term programs allow a null connection, without a carrier detect. Notably, 'Express 850' does not. I have only used 'Procomm 2.4.3' (the last shareware version of Procomm) on the PC and Bob Term on the Atari, but other term programs may work.

To check your null modem connection, start both PC and Atari term programs, set baud to 2400 or 4800 on both computers. No parity, 8 data bits, 1 stop bit on the PC. Be sure to use the correct COM port on the PC. Go to 'terminal' mode and you should now be able to type on either computer and see it on the other screen. To accomplish a file transfer, use Y-modem probably from Bob Term, rather than X-modem. X-modem will often append

bytes to a file transfer, an undesirable event. There is also a very nice Z-modem recieve program for the Atari, called AtarZmodem by Larry Black for the Atari.

A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors (Radio Shack) some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modems and plugging in the null modem cable into the two modem cables. This also avoids the confusion of variations in the computer ports. Most computers connect into the modem end via a standard RS232 DB25 connection. With this both ends 25 pin cable, you would cross pins 2 and 3 and connect the #7s together to make a null modem cable.

The SIO port on the Atari cannot be used directly. An 850, P:R: connection, MIO, Black Box or similar device that provides an RS232 port must be used.

Following are pin assignments for a DB25 pin RS 232 C port.
1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

For higher speed connections, above 4800 or 9600, you need the flow control lines and Atari term software that has flow control built in. You also need an MIO or Black Box, which uses the PBI (parallel bus). A high speed cable would need not only XMT, RCV, and GND, but also flow control lines. I suggest a commercial null modem from computer store to ensure correct lines. A null modem is a small adapter with the correct lines already crossed. I don't know how to correctly connect the CTS, RTS, DTR, DSR, CRX lines for a high speed null modem. With a null modem, you just plug it into the 25 pin connectors of the two modem cables you might already have connected to your Atari and PC or Mac. You may need a straight thru 25 pin gender changer also.

Following is in this FAQ elsewhere, but I summarize here: (Figure out or look for pin numbers on the ports.) Note that these are pin assignments, and NOT null modem connections with the XMT, RCV crossed and GND straight thru.

Atari 8-bit PC AT 25 PC AT 9 pin
----
1. DTR 20 4*
2. CRX 8 1*
3. XMT 2 3
4. RCV 3 2*
5. GND 7 5
6. DSR 6 6
7. RTS 4 7
8. CTS 5 8
9. No connect? shield RI
22 RI

Note: * above indicates the difference between an AT 9 pin
and a Atari 8-bit 9 pin cable connector. eg. If you check
continuity from pin 3 of 25 pin end and it goes to pin
4 of nine pin end, you have an Atari serial cable. If pin
3 of 25 pin goes to pin 2 of 9 pin end, you have a PC
serial cable.
(updated 3/1/99)
(DTE = Data Terminal Equipment ie. your computer.
DCE = Data Communications Equipment ie. your modem.)

Subject: 11.5) What is SIO2PC?

From the SIO2PC home page, written by Nick Kennedy:

SIO2PC is a hardware & software package interfacing the 8-bit Atari to PC
compatible computers.

The original idea was to have the PC emulate Atari disk drives so Atari
programs could be stored on the PC's hard (or floppy) drives. It turned out to
be quite successful. About 95% of my work was in the software, but a hardware
device to convert logic levels was also necessary. This device is now commonly
referred to as an SIO2PC cable.

Features:

Emulates 1 to 4 Atari disk drives

Store your Atari files on PC hard or floppy drives

Boot from the PC, real drive not needed to start-up

No software or drivers required for the Atari;
no conflicts: use your favorite DOS

Twice as fast as an Atari 810 drive and more reliable

Co-exists with real drives in the Atari daisy chain

Compatible down to the hardware level: use sector copiers, etc.

Print-Thru captures Atari print-out and routes to PC's printer

Convert Atari files to PC files and vice versa

1050-2-PC version connects PC directly to Atari disk drive

Nick Kennedy
mailto:nkennedy@cswnet.com
http://www.cswnet.com/~nkennedy/

Another source for building SIO2PC cables is Clarence Dyson's page at
http://www.redshift.com/~cdyson/atari.html

Subject: 12.0) What are the Atari 810, 1050, and XF551 Disk Drives?

==> Atari 810. The least common denominator for the Atari.

Single-Sided, Single-Density
40 tracks x 18 sectors/track x 128 byte/sector = 90K capacity
19200 bps transfer rate
Shipped with DOS 1 or DOS 2.0S

==> Atari 1050

Same as the 810, plus "Enhanced"/"Dual" Density capability:

40 tracks x 26 sectors/track x 128 bytes/sector = 128K capacity

Shipped with DOS 2.0S, DOS 3, or DOS 2.5

DIP switches:
Black & white left: Drive 1
Black right, white left: Drive 2
Black left, white right: Drive 3
Black & white right: Drive 4

==> Atari XF551

Same as the 1050, plus DS/DD capability:

80 tracks x 18 sectors/track x 256 bytes/sector = 360K capacity

Writes "backwards" to the second side of the disk, rendering it incompatible
with existing third-party 180K formats on the reverse side of the disk.

High speed 38400 bps burst mode usable only with SpartaDOS X, SuperDOS
5.1, TurboDOS, DOS XE, and patched SpartaDOS 3.2.

Shipped with DOS 2.5 or DOS XE.

DIP switches:
Both dips down: Drive 1
Left down, right up: Drive 2
Left up, Right down: Drive 3
Left and Right up: Drive 4

Rotaton rate: 300RPM. All other Atari drives: 288RPM

More on the XF551 from Andreas Magenheimer:
There are two versions - one from Mitsumi and one from Chinon.
The Mitsumi Xf drive can read and write to a single/dual/double density backside of a 5,25" disk (side b) if it is already formatted. The Chinon drive cannot read nor write nor format the backside because it always looks for the timing hole !! (If you insert a B-side of a disk without a timing hole, it does not stop spinning around...even if this disk is formatted) Therefore the Chinon drive has a flop-mechanism and a sort of automatic-density detection (which is not supported by the OS !!). If you put in a disk, the drive motor starts, trying to read that disk...

For better understanding: a Mitsumi drive may need a flop mechanism (so a disk "flops" out, when opening the switch), a density detection (to know the correct density - like a 1050 does !!) and a timing hole redirection (thus not needing a timing hole). The Chinon drive would merely need a timing hole redirection. Both drives then should have a new OS that uses the capabilities to automatically detect the density...

On another matter, Rich Mier writes:

You've been plugging and unplugging the SIO cable with the 1050 power pack plugged in, right? That's a no-no. Most of the time it's Okay, but about 1 in 10, 20 times, it will blow out 'U-1'. It's a CA/LM 3086 I.C. at the right, rear of the main board. A 14 pin DIL chip. Actually it is an array of 5 transistors.

Unplug the power pack from the 1050, then unplug the SIO cable. Power can be ON on the CPU. The problem has to do with the secondary winding of the Power Pack. Remember, the problem only occurs 1 out of 10 - 20 times that you do it, not all the time.

It doesn't really matter if the 1050 Transformer has power on or off, it 'Might' happen if plugged into the 1050. It is really bad on 810's.

One thing, if the system has been turned off for, oh say, 5 - 10 minutes it won't matter. By then all the capacitors should be bled(sc?) to 0 volts.

Speedy 1050
SS SD/ED/DD 55-57k bps

Super Speedy 1050
SS SD/ED/DD Like the Speedy 1050, but enough RAM on board to
hold the contents of an entire disk

More about Speedy from Andreas Magenheimer,mailto:magea000@mail.uni-mainz.de:
Speedy or Big Speedy means: old Speedy version, big size, big
price, avaiable (or ability to update) with Track LCD. Used a big plate
and older chips/older layout. There were different versions of Speedy,
like Speedy D (with DOS on ROM chip), Speedy S (with sectorcopier on ROM
chip), Speedy DS (DOS and Sectorcopier on ROM chip) and finally Speedy T
(Track LCD). The price for these big Speedy enhancements was very
high...

A Mini Speedy simply was the newer Speedy version. It has merely half
the size of a big speedy, thus newer chips and a newer layout. It has
DOS and a Sectorcopier in a ROM chip. It could not upgrade with a Track
LCD, therefore it was much cheaper !! The DOS mentioned was Bibo-DOS,
the Sectorcopier was Sector-Copy 1.5.

Compared to a Happy, a Speedy as well uses a Track/Cache buffer for
Ultra Speed. Thus, a Speedy is nothing more than a European Happy
Enhancement clone. Many Happy software tools (DOS, Gamedos, Filecopier,
Sectorcopier, etc.) can be used on Speedy drives, but some special Happy
software cannot be used on Speedy drives and vice versa.

SuperMax 1050
SS SD/ED/DD 19.2k and 52k UltraSpeed

Subject: 12.4) What do I need to connect a hard drive to my 8-bit Atari?

original by mailto:Krishna@max.tiac.net (Glenn M. Saunders)

For starters, you'll need to obtain one of the following interfaces:

==> Corvus hard drive (10 megabytes)
Rare.
Fast but still relatively slow I/O, kludge through joystick ports for 800.

==> KPI Hard Disk Drive Interface (formerly Supra)
from K-Products (bobkla19@mail.tcd.net - Bob Klaas)
Some limitations on drive type and size and total number of drives in sys.

==> Multi I/O (MIO) (formerly from ICD)
from Fine Tooned Engineering (FTe) (ftooned@crl.com - Mike Hohman)
256 byter per sector restriction. 256K and 1 meg ramdisk models.
Printer and modem, modem will handle 19.2K bps

==> Black Box
from Computer Software Services (CSS) (mailto:audioguy@cheerful.com - Bob Puff)
Will handle all SCSI drives. Allows 9 drive access for MYDOS. Currently the
only modem interface with CTS/RTS hardware flow control. 19.2K ready.

==> SWP ATR-8000
Rare daughterboard for hard drives.
I/O is probably fairly slow on this baby and there may be DOS restrictions.

==> IDE Hard Drive Interface
from Konrad M. Kokoszkiewicz and Jacek Zuk
(see http://www.orient.uw.edu.pl/~conradus/docs/ide_eng.html)
o Maximum drive capacity: 16777215 physical blocks on each device.
o Maximum number of partitions: 16
o Maximum capacity of a partition: 16777215 logical sectors
o Logical sector length: 256 or 512 bytes
o Average speed (in kilobytes per second, WDC 130AB drive):
- Native mode, sequence of sectors (R): 75
- Emulation mode, sequence of sectors (R): 43
- Emulation mode, back sequence (R): 28
- Emulation mode, random sectors (R): 13
- Emulation mode, same sector (R): 29
- Emulation mode, DOS file (W): 7
- Emulation mode, DOS file (R): 36
o Booting from any partition (on the standard XL OS)
o Write protection capability
o 8 jumpers to set the device number for the operating system
o Sweet 16 compatibility

==> Fine Tooned Engineering Multi I/O II
An IDE interface. Released?

Subject: 12.5) What should I know about modems and the Atari?

Thanks to Bob Puff and Clay Halliwell for helping me with this section.
But I'm still not real confident about the accuracy here. I'd love for
anyone to help me fix up this section!

There are three types of modem protocols: modulation protocols, error
correction protocols, and compression protocols. The international
standards for these protocols are laid down by the branch of the United
Nations known as the ITU-TSS (formerly the CCITT). ITU standards are
known by their "V-Dot" names. They're only names, don't try to apply
any meaning to the names.

Modulation protocol standards, the major ones
(bits per second)
300 bps - V.21 (103J is used instead in the USA)
1200 bps - V.22 (212A is used instead in the USA)
2400 bps - V.22bis
9600 bps - V.32
14.4 Kbps - V.32bis
28.8 Kbps - V.34

Error Correction standard:
V.42 - requires either software or hardware flow control

Compression standard:
V.42bis - requires V.42, and hardware flow control.

If your modem is capable of V.42bis compression, set your communications
software to enable hardware flow control. If your terminal interface
allows you to set the terminal<->modem (DTE) and modem<->modem (DCE)
baud rates separately, you should set the DTE rate to the maximum
allowed. If the DTE and DCE cannot be set separately, set the terminal
baud rate at four times the maximum actual data rate of your modem
(V.42bis achieves a compression ratio of up to 4:1). Examples: If a
V.22bis/V.42bis modem is used, set the terminal for 9600 baud. If a
V.32/V.42bis modem is used, set the terminal for 38400 baud. If a

V.32bis/V.42bis modem is used, set the terminal for 57600 baud.

Let's define a "high-speed" modem as a modem capable of V.42bis compression.
(Some 2400 bps modems, and all modems faster than that)

Using high-speed modems on the Atari

Unless you're using a CSS Black Box or a patched MIO, the 8-bit Atari
RS232 interfaces do not support hardware flow control. (I have heard
that the P:R: Connection does too, but it can't be controlled in
software.) So we must send the modem a command to tell the modem not to
use it. Using a Hayes-compatible modem, the modem command AT &K4 will
enable software flow control, and disable hardware flow control. AT &K0
will disable all flow control.

The MIO patch, HyperSpeed by Len Spencer, is available at:
http://members.aol.com/lenspencer/atari8.htm

Question. Why does my modem report V.42bis is used even when my terminal it
set for the same speed as my modem?

Cause the modem will do what you tell it. You've configged it to talk at the
highest speed, using LAP/M, and compression. Even if you connect modem to
modem at 14.4k, you can be talking to the modem at 300 baud, and it will still
use everything. You'll undoubtedly drop bytes, but hey...

Question. Why does V.42bis compression appear to function after I have sent
the modem the AT &K4 or AT &K0 commands? And knowing the Atari doesn't
support hardware flow control?

Compression doesn't have to have flow control to work. Same as above - its
just an added step that the data goes through. Note that if the modem's input
buffer is small, you can overrun it easily if you send it data faster than it
can digest and send. That's why you -really should- be using flow control
with compression... But it's not a necessity.

Question. Why does V.42 error correction appear to work even when I have
disabled flow control with the AT &K0 command?

Question. Why don't I have problems performing binary downloads when I have
software flow control enabled? (flow control characters could appear in data
stream accidentally)

Depends on the protocol. Zmodem accounts for spurious XON/XOFFs. Xmodem and
Ymodem don't. Also, you are able to digest the data as fast as the modem is
giving it to you, hence no flow control is happening. I suspect it would be a
different case if you were uploading using a streaming protocol like Ymodem G.

More tips, from Clay Halliwell:
On 11 Feb 1996, mgfrank@acsu.buffalo.edu (Marc G. Frank) said:

> I'm having problems getting a modem attached to my Atari 850 to
> communicate at 9600 baud. When I set my communications program to 2400
> baud, everything works fine. However, when I set it to 9600 baud, the

> modem echoes my characters but doesn't act on them. That is, at 2400,

The problem with the 850 is that some of them (like mine) don't produce a
PERFECT 9600 baud signal. As a result modems can't train on it, and while
they will echo characters back, for some nitpicky reason they won't pick up
on the "AT" attention code.

The solution is to do all your dialing at 2400 baud, but set the S37
register to force the modem to try to connect at 9600. Then switch your
Atari to 9600 after connecting.

Jon Melbo responded to me in 1997:
On Fri, 21 Mar 1997 11:06:11 -0600, "Michael Current"
<mcurrent@carleton.edu> wrote:

>I have a Zoom 2400bps V.42bis modem, connected through a P:R:Connection. I
>need to do the
>at&k4 no matter what I'm dialing into, and no matter what comm program I'm
>running.
>
>Nobody's ever really been able to explain it to me, but I know it has helped a
>few other people. Try it!

What &K4 does is select XON/XOFF flow control. Apparently, all/most
atari serial interfaces or at least R: handler software does not
support hardware (CTS/RTS) handshaking (selected on the modem via &K3
which is also a default). Anyway, that's why the &K4 setting helps a
lot.

Glenn Saunders responded to other writing of Jon's, 4/5/97:
: 28.8 CARRIER connects are possible BB or no, it's just that there is
: no point in having your modem do data faster than your puter can.

It simplifies modem configuration to let the modems connect at their
native speeds.

: Right! But you should never have your DCE to DCE speed exceed your
: DTE to DCE speed. Never, unless you like errors and strange behavior.
: With a BB, one should use CTS/RTS flow control, and force the modem to
: operate at a maximum of 19.2 PERIOD (this means disable compression).

It doesn't really matter. CTS/RTS can throttle the I/O down as much as it
needs to. The faster modem will wait for I/O without any complaints.
Disabling compression isn't a good idea because it will disable it for ALL
calls including 9600 or 14.4 users in which it could do some good even on
an 8-bit BBS. Software flow control is pretty much dead in
telecommunication, and has been dead as long as data compression has been
standard since the stop and start commands take way too long to register
that way.

: If using some other serial interface, I would use software flow
: control, disable data compression on the modem, force the modem to a
: max speed of 9600bps, and experiment with error correction. Does

This combination is deadly for most modern users unless they degrade their modem via reconfiguration. And if users have to do this, odds are they will stay away rather than futz with AT settings to get a reliable connect. That's why I think the MIO essentially died as a viable BBS interface when 14.4s became standard. They won't work well unless the "mythical" hardware flow control of the thing is enabled in some way.

An explanation of XON/XOFF from Eric Sokolowsky, 4/11/97:

I looked in my modem manual, and the at&k4 command enables XON/XOFF flow control, which is a form of software flow control. As I understand it, when a XOFF is sent by the receiving end of a line, the sending end holds off sending for a little while to give the receiving end a chance to catch up. When the receiving end catches up, it can send a XON which tells the sending end to continue sending. Using this should reduce the liklihood of dropped characters. It's not as good as hardware (RTS/CTS -- check out the FC light on most high-speed external modems on fast transfers) flow control (enabled by default or the at&k3 command), but it's good enough for the Atari, which as I understand, doesn't normally allow hardware flow control, unless using such a device as the Black Box.

to which Robert Ely responded:

Just a quick addition. If you are using a modem at 9600bps or faster, don't use xon/xoff, use the RTS/CTS. Since you can do this with the MI/O and BlackBox, use it for all it's worth. If you are on an 850 or P:R:Connection, you won't be able to deal with it and probably won't be going at or above 9600bps anyway.

Subject: 13.1) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system.

Either MYDOS or SpartaDOS will work with almost any disk drive, up to 8 drives or hard disk partitions, and ramdisk.

MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. MYDOS 4.53 is freeware from Wordmark Systems (Charles Marslett and Bob Puff). There are two versions of MYDOS 4.53, one uses 3 digit sector numbers where possible, known as 4.53/3; the other, known as 4.53/4, uses 4 digits minimum. Complete documentation about the disk formats and commands, as well as the source code, is available.

SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2g and 3.2gx are disk-based; SpartaDOS X 4.22 is cartridge-based and includes many additional features. SpartaDOS 3.3a and 3.3b were rewritten by Stephen J. Carden for use with BBS Express PRO!. SpartaDOS 3.3c is produced on a 16K ROM cartridge from Video 61.

It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the archives.
filenames: Os/dos25.arc (DOS 2.5)
Fte/fte32g.arc (SpartaDOS 3.2g)
Os/mydos453.dcm (MYDOS - latest version)
Os/mydos45m.arc (MYDOS - latest complete doc's)

Another popular, powerful DOS is BW-DOS, freeware by Jiri Bernasek.
BW-DOS 1.30 and all other versions are available via:
http://atari.boss.com.pl/files

Carolyn Hoglin, mailto:choglin@usa.net adds:
I didn't see TOP-DOS mentioned anywhere. This superior DOS was written by R. K. Bennett of Eclipse Software in Sunnyvale, CA. It was based on Atari DOS, but with many, many more features. It fully supports my double-density, double-sided Astra drives, automatically sensing the proper density and sidedness of both drives 1 and 2. (MYDOS only seemed to do that on drive 1.) Also supported are large ramdisks for Axlon, Mosaic, etc. The latest version was TOP-DOS 1.5+, which came with an excellent manual explaining how to use its powerful capabilities.

Any other versions of DOS all 8-bit Atari users should be aware of??

Subject: 13.2) What hardware has Atari created in the 8-bit computer line?

Computers:
400 Home Computer (1979) 8/16K, membrane keyboard, 400/800 OS
800 Home Computer (1979) 8/16/48K, two cartridge slots, 400/800 OS
1200XL Home Computer (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL Home Computer (1983) 16K, BASIC, PBI, XL OS
800XL Home Computer (1983) 64K, BASIC, PBI, XL OS
65XE Personal Computer (1985) same as 800XL minus PBI (Europe: includes ECI)
130XE Personal Computer(1985) same as 65XE with 128K plus ECI
800XE Personal Computer(1987?)same as 130XE but 64K. Mostly eastern Europe.
XE Game System (1987) same as 65XE plus Missile Command, detach keybd

Peripherals:
410 Program Recorder -Japan and Hong Kong versions. 410a - Taiwan version
810 Disk Drive -SS/SD 90K with DOS 1 or DOS 2.0S,MPI&Tandon vers.
820 40-Column Printer -
822 Thermal Printer -40 col.
825 80-Column Printer -req. 850
830 Acoustic Modem -300 baud req. 850, w/ Telelink I. =Novation 'CAT'
835 Direct Connect Modem -300 baud, with Telelink II software
850 Interface Module -4 9-pin serial, 1 15-pin parallel ports, beige & black metal versions
1010 Program Recorder -Sanyo and Chelco versions
1020 Color Printer -40 col.(80 by command) print/plot in 4 colors

mailto:rrs0059@ibm.net (Frank McKenney) writes:
The printer/plotter mechanism for the Atari 1020 is
(I believe) the same one used in the Tandy/Radio
Shack CGP series and the Commodore 1520(?), and
was
made by a company named ALPS.

(Curt Vendel, mailto:webmaster@atari-history.com)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
800D (Developers Bus System)
1000 Sweet 16 Project, lower end model. Became the 1200XL
1000-X Sweet 16 Project, higher end model. Became the 1200XL
1200 1200XL internally, many slight cosmetic differences
1200XLS 1200XL Show prototype, top-mounted cartridge slot
600 early 600XL, all black case, joyports on the left, missing PBI
800XL brown prototype
800XLF late 800XL with a redesigned motherboard, plus the FREDDY chip
800XLD low-cost 1450XLD, no modem&speech, include disk drive
controller&FREDDY
1250XLD Earlier name for the 1450XLD
1400XL brown prototype
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL 1400XL plus room for 2 internal 5.25" drives (controller not included)
1450XLD 1400XL plus 5.25" floppy drive (Epson SD521 360K disk drives)
1600XL Amiga/Amiga-like.Now appears that 1850XLD was the model name for this
1650XLD to use 1450XLD case and 1200XL keyboard
1850XLD "Mickey" Atari clone of the Amiga Lorraine
65XEP 65XE plus 3.5" floppy drive, 5" green monitor

65XEM 65XE plus AMIE/AMY sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 Dual Disk Drive -2 x SS/DD 180K with DOS 2.0D
1027 PLUS -daisy-wheel, 80 columns
1053 -looks like a 1050, but supports DS/DD 360K format
1055 -a 1050 (SS/ED) with a 3.5" mechanism
1060 CP/M Add-On Module -"SweetPea" Z-80 CPU, 64K RAM, CP/M 2.2, 80 col display
1090 XL Expansion System-5 PBI slots, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XF351 -a 3.5" drive.
XC35 -an XF551 with a 3.5" mechanism
XTM201 -non-impact printer
XTC201 -XE Thermal Color Printer

Subject: 13.3) What are the power-supply requirements for my Atari
components?

Thanks to Matthias Belitz, mailto:matz@kawo2.rwth-aachen.de for the European
data in this section. I need more international help!

As with the rest of this FAQ list, please let me know if any of this
information conflicts with the units you have.

The most important information is the voltage (in volts) required, and
whether you need a transformer (AC output) or an adapter (DC output).
The power (in voltamps or watts) and current (in amperes) specifications
of the original equipment as presented here should be regarded as
minimum values. Higher-than-specified power and current capacities are
entirely usable, and often preferable because such supplies run cooler
and last longer.

Direct Current:
Power (in watts) = current (in amps) * voltage (in volts)

Alternating Current:
Apparent Power (in voltamps) = current (in amps) * voltage (in volts)
Effective/True Power (in watts) = current (in amps) * voltage (in volts)
* (cosine of the angle of lag)

Subject: 13.5) What BBS software can be used on the Atari?

This section mostly by mailto:winston@merk.com (Winston Smith)
Credit for AMIS to MACE by Steven Sturza, mailto:cordata@ameritech.net

o A.M.I.S. BBS -- The A.C.E. Message Information Service.
The AMIS BBS was written in BASIC by people from the
Michigan Atari Computer Enthusiasts. It included designs for a ring-detector.
You needed a sector editor and had to allocate message space by hand, hex byte
by hex byte.

Steven Sturza adds:
The AMIS BBS was written by people from the Michigan Atari Computer
Enthusiasts.

o FoReM BBS -- Friends of Rickey Moose BBS.
At the time, there were a lot of BBSes around
called things such as "FORUM-80" and "BULLET-80", ergo the name. FoReM BBS
was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed
in BASIC and was somewhat crashy. I think that this is the
great-grandparent of the FOREM-XE BBSes that survive today.

Matt Singer, mailto:msinger@oe.fau.edu writes:
FoReM BBS derived from an early AMIS. When multiple message areas were
added the name was extended to FoReM 26M. Then, When OSS released BASIC
XL the program was rehacked and called FoReM XL... Bill Dorsey wrote most
of the Assembler routines (where is he now?).

o ABBCS -- The ANTIC Bulletin Board Construction Set.
The user design of the ABBCS was very good. It sported
features such as intra-line editors. Unfortunately, the coding of the
ABBCS was really poor. You could practically blow on your keyboard and
crash this BBS. The BBS would sometimes crash several times a day.

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston,
Massachusetts, USA, area. I'm not sure whether his BBS for the
Atari 8-bit has been placed into the public domain or not. This BBS was
the first to support a RAMdisk, which Paul Swanson called a "V:" device
for "virtual disk". This BBS was written in Atari BASIC and required a
joystick hardware "dongle" device. This was notable as being one of the
first Atari 8-BIT BBSes that could actually go for a week without having
to be rebooted. Pointers to the message base were kept in an Atari "very
long string" (for which Atari BASIC is famous). The BBS would only have
problems (for the most part) if this string became corrupted.

o ATKEEP -- An Atari 8-bit version of CITADEL BBS.
I believe that AT-KEEP, like FOREM-XE, requires the use of
the commercial BASIC XE cartridge to run. This BBS program was very
popular around Louisiana, USA, from what I understand.

o Benton's SMART BBS -- BBS written in BASIC by Marco Benton.
This program is written entirely in BASIC. It
expects to be running under a SpartaDOS environment. This was a problem
until very recently, when the disk-based version of SpartaDOS was
re-released as shareware. This BBS program uses a "modem clock string"

rather than an R-Time 8 cartridge in order to retrieve the current time.
It also comes with an Atari BASIC game door called "Sabotage".

o FOREM-XE -- FOREM using BASIC XE.
This version of FOREM BBS requires the commercial BASIC XE
cartridge in order to run. It is in the public domain and can import and
export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only,
control ATASCII graphics are reserved for message data-structure bytes).
FOREM-XE BBS is still currently in use as we speak, and may be reached via
the PRO! EXPRESS-NET as long as the cross-networking "transnet" is still in
effect.

o The BBS Express -- PRO! BBS demo program.
This is the public domain version of EXPRESS!-BBS,
which is the Keith Ledbetter companion project of the EXPRESS!-TERM
terminal program of days gone by. I am not familiar with this program. I
think that it is written in Action! and only supports XMODEM Checksum
transfers. I have never called or seen this program demonstrated.

o OASIS JUNIOR III -- OASIS BBS demo program.
OASIS JUNIOR III is the --ALL MACHINE LANGUAGE--
demo version of the OASIS BBS program. OASIS is very crash-resistant and
comes with a "dial out" screen so that the Sysop can use the BBS as a
terminal program to call and fetch files without having to bring the BBS
down and reload a terminal program. OASIS supports "Door programs" which
it refers to as "OASIS PAL modules". This OASIS demo module comes with an
excellent message system. The OASIS file system is one of the most
complicated that I have ever seen. It consists of "file libraries" with
suites of "file types". There is quite a bit of overhead involved in
performing a download (which may be a good thing, as it discourages file
hogs). There is a commercial version of OASIS called "OASIS IV" that
performs networking. There was an OASIS network between Boston,
Massachusets, USA and Murfreesboro(SP?), Tennessee, USA. Occasionally word
of the OASIS IV developers reaches the network from New Zealand or Canada.

o Frank Walters BBS -- I know nothing about this BBS except that Frank
Walters wrote it.

o Carina BBS -- a shareware product of Shadow Software.

o BBS Express! Professional -- a product of Video 61, www.atarisales.com

o OASIS IV -- a product of ???

o Forem-XE Pro -- by Len Spencer. http://members.aol.com/lenspencer/

Subject: 13.6) What versions of Atari BASIC or the CTIA/GTIA chip do I have?

Atari BASIC:

At the READY prompt, enter "? PEEK(43234)"

If the result is: You have Revision:
162 A
96 B
234 C

Freddy Offenga, mailto:F.Offenga@student.kun.nl adds:

there's another good answer (IMO):

You can also take a look at the part numbers on the IC's
inside your Atari and compare them with the numbers from
the following table:

Part# Version
~~~~~~~~~~~~~~~~~~~~ ~~~~~~~~
CO12402 + CO14502 A
CO60302A B
CO24947A C

On versions A, B, and C, Greg Miller writes:

"Rev A had a number of bugs, not just the commonly
described crash bug. Rev B fixed most (maybe all, I don't remember) of
these, but in the process, they added a new bug. You see, the crashes
were caused by a bug in one of OSS's memory move routines. When the bug
was fixed, the fix mistakenly applied to a routine that actually worked
in Rev A, causing the new lockup problem.

Rev C differs in only a few bytes. AFAIK, the only change was to remove
the alteration made to the routine that was broken by Rev B.

You can get more details from the annotated source listing published by
Compute! books. Bill Wilkinson described many of the problems in detail.
He also talked about it in his column in Compute! magazine."

CTIA or GTIA installed?

In BASIC, type POKE 623,64 [RETURN] and if the screen blackens, you have the
GTIA chip. If it stays blue, you have the old CTIA chip.

By the way, apparently no CTIA-equipped Ataris were shipped to Europe.

Clay Halliwell, mailto:earl.halliwell@dyess.af.mil provides this tidbit:

A bit of trivia: CTIA 400/800s artifacted in blue/green, GTIA 400/800s
artifacted in green/blue, and all XL/XEs artifact in red/blue.

Subject: 13.7) Which versions of the Operating System (OS) are there?

This section also kept at http://www.student.kun.nl/f.offenga/osroms.txt

Atari 8-bit Operating Systems
~~~~~~~~~~~~~~~~~~~~~~~~~~~~

Version 3.3, 6/27/1999.
By Freddy Offenga (mailto:F.Offenga@student.kun.nl)

400/800 10kB OS roms
~~~~~~~~~~~~~~~~~~~~

Rev.	TV	Date	CRC-32	Part Nr(s)
A	NTSC	(?)	(?)	(?)
A	PAL	(?)	0x72b3fed4	CO15199, CO15299, CO12399B
B	NTSC	(?)	0x0e86d61d	CO12499B, CO14599B, 12399B
B	PAL	(?)	(?)	(?)

XL/XE 16kB OS roms
~~~~~~~~~~~~~~~~~~

Rev.	System	Date	CRC-32	Part Nr(s)
10	1200XL	10/26/1982	0xc5c11546	CO60616A, CO60617A
11	1200XL	12/23/1982	(?)	CO60616B, CO60617B
1	600XL	03/11/1983	0x643bcc98	CO62024
2	XL/XE	05/10/1983	0x1f9cd270	CO61598B
3	800XE	03/01/1985	0x29f133f7	C300717
4	XEGS	05/07/1987	0x1eaf4002	C101687

(?) This information is missing. If someone can supply this info,
please write me an e-mail.

NOTES:
The 400/800 O.S's consist of three ROMs (two 4kB and one 2kB).
The 1200XL contains two ROMs for the OS (8k each), XL/XE's use a single
16k ROM and the 16k XEGS OS is stored in a 32k ROM (together with 8k
BASIC and 8k for Missile Command).

Origins of ROM information
~~~~~~~~~~~~~~~~~~~~~~~~~~
400/800 rev.A NTSC Could exist, since the PAL version exists and
rev.A is mentioned in the rev.B source code.
400/800 rev.A PAL All info found in two Atari 400's and Atari 800
ROM module CX801.P
400/800 rev.B NTSC Information from a ROM dump and the rev.B source
listing. The part numbers were listed in the
catalog from 'Best Electronics'. According to
'Mapping the Atari' rev.B ROMs have a 'B' at the
end of the part number, therefore I figure these
part numbers are from rev.B.
400/800 rev.B PAL Could exist, since the NTSC version exists and
there's some conditional PAL/NTSC assembly in
the rev.B source code
1200XL rev.10 PAL/NTSC All info found in an Atari 1200XL. The XL/XE
rev.2 source code refers to it as rev.10.
'Best Electronics' calls it rev.A.
1200XL rev.11 PAL/NTSC Refered to rev.11 by the XL/XE source code.
~~~~~~~~~~~~~~~~~~~~~~~~~~

'Best Electronics' calls it rev.B.
XL/XE rev.1 All info found in an Atari 600XL
XL/XE rev.2 All info found in an Atari 800XL
XL/XE rev.3 All info found in an 800XE
XL/XE rev.4 All info found in an Atari XE Game System

O.S. Authors and dates
~~~~~~~~~~~~~~~~~~~~~
The following info is from the Atari XL/XE rev.2 source code.

Revision A (400/800)
D.Crane / A.Miller / L.Kaplan / R.Whitehead

Revision B (400/800)
Fix several problems.
M.Mahar / R.S.Scheiman

Revision 10 (1200XL)
Support 1200XL, add new features.
H.Stewart / L.Winner / R.S.Scheiman /
Y.M.Chen / M.W.Colburn 10/26/82

Revision 11 (1200XL)
Fix several problems.
R.S.Scheiman 12/23/82

Revision 1 (600XL/800XL)
Support PBI and on-board BASIC.
R.S.Scheiman / R.K.Nordin / Y.M.Chen 03/11/83

Revision 2 (600XL/800XL)
Fix several problems.
R.S.Scheiman 05/10/83
Bring closer to coding standard (object unchanged)
R.K.Nordin 11/01/83

Vapour-ware
~~~~~~~~~~~
The following OS roms originate from rare Atari 8-bit systems.
Since I don't own any of these (unfortunately), I don't have much
information about these roms. Who can help me?

I've got two 16K rom dumps from the 1450XLD. Both ID's are rev.3.
The first dated 3/23/1984 comes from the 'Pooldisk Too' CD-ROM
(filename: 1540os3.v0) and the second dated 6/21/1984 was send to
me by Nir Dary (filename: os1450.128). Main differences between
these two are in the first 3K ($C000 - $CBFF).

The XL/XE OS rev.3B is from an Atari from Arabia. It's probably based
on rev.3. There are changes in the fonts (Arab characters) and several
patches in the code. More info at:
http://www.savetz.com/vintagecomputers/arabic65xe/

Rev. Found in Size CRC-32 Date
~~~~ ~~~~~~~~ ~~~~~ ~~~~~~~~~~ ~~~~~~~~~~
3 1450XLD 16kB 0x0d477aa1 3/23/1984
3 1450XLD 16kB 0xd425a9cf 6/21/1984
3B 65XE 16kB 0xf0a236d3 7/21/1984

~~~~~~~
Special thanks to Nir Dary for the rev.2 source code, rom dumps and
the 1200XL. It's in good hands.

Subject: 13.8) What games support 4 simultaneous players on the 400/800?

contributors to this section:
mailto:jlodoen@shell.portal.com (Jeff M Lodoen)
mailto:olavese@online.no (Vidar \"Hawk\" Olavesen)
mailto:pmulvey@erols.com (Pat Mulvey)
mailto:stevenposey@usa.net (Steven E. Posey) (Party Quiz controllers descr)

The following games support 4 player head-to-head play. Remember, only the
400 and 800 computer models sport 4 controller ports.

Asteroids, Basketball, Dandy, M.U.L.E., Maze War, Silicon Warrior, Survivor,
Thorn EMI Soccer, Major League Hockey

The following support 8 players on the 400/800 or 4 on the other computer
models, using the 2 controllers-per-port CX30 Paddle controllers:

Super Breakout, Worms?

The following supports 4 players on all machines, using special 4-button keypad
controllers linked together with RJ-11 jacks (standard phone jacks) to a box
with 2 joystick port connectors.

Party Quiz by Suncom

Subject: 13.13) What programming languages are available for the Atari?

This section also kept at http://www.student.kun.nl/f.offenga/lang13.txt
~~~~~~~

Revision : 1.3
Date.... : 4/19/1999

==========
!!!! This section is under construction - HELP WANTED !!!!

The goal is to give information about all available languages
for the Atari 8-bit computer. This information will include:
title, last version, author, date and a short description.
It would also be nice to know how to get it and where to get
more information (like reference cards, reviews and such).

Freddy Offenga, mailto: F.Offenga@student.kun.nl
==========

There are quite a lot! To get some structure in this section it's
divided into the following categories;

a) ASSEMBLER
b) BASIC
c) C
d) PASCAL
e) LISP
f) FORTH
g) PILOT
h) LOGO
i) All the rest

The following format is used:

- Language titel (medium)
version, year : version, year
author/company : author/company
available..... : where/how to get it
package....... : programs, documentation
features...... : main features
Description.

The question marks (?) indicate that more information is
required about that topic.

Definitions:
umich University of Michigan Atari archive

Some resources:
- The Multi-lingual Atari, Analog magazine 45, August 1986
- A bunch of manuals
- Some copy-pasted lines from the Atari 8-bit newsgroup

a) ASSEMBLER

- 130XE+ Makro Assembler (disk)
version, year : 2.2, 1992
author/company : Torsten Karwoth
available..... : freeware, ?

package..... : assembler, editor, menu, monitor,
batch enhancement, linker/packer
features..... : macros
Two pass 6502 assembler with integrated menu, editor
and monitor shell. Needs extra RAM banks. Source
format is derived from Atmas Makroassembler.

- A65 (disk)
version, year : ?, 1989
author/company : Charles Marslett, WORDMARK Systems
available..... : freeware, ?
package..... : assembler, manual
features..... : source include
Two pass 6502 assembler. Source format is based on the
Atari Macro Assembler. Assembler source included.

- Alfasm, Turbo-Assembler/16 (disk)
version, year : 1.0, 1990
author/company : Jeff Williams, DataQue Software
available..... : ?
package..... : assembler, docs
features..... : source include
Two pass 6502/65816 assembler.

- Atari Assembler/Editor (cart)
version, year : ?, 1981
author/company : Atari
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : -
Two pass 6502 assembler with integrated editor/monitor

- Atari Macro Assembler (disk)
version, year : 1.0C, 1981
author/company : Atari, APX
available..... : ?
package..... : assembler, editor, debugger, manual
features..... : macros, source include
Two pass 6502 assembler.

- Atmas Makroassembler (disk)
version, year : 2, 1985
author/company : Peter Finzel, Hofacker
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : macros
Two pass 6502 assembler with integrated editor/monitor.

- Bibo Assembler (disk)
version, year : ?, 1986
author/company : Compy-shop
available..... : ?

package..... : assembler, editor, monitor
features..... : source include, data include
Two pass 6502/65c02 assembler with integrated editor/
monitor.

- Datasm/65 assembler (disk)
version, year : 2.0, 1981
author/company : DataSoft Inc.
available..... : ?
package..... : assembler, editor, menu, manual
features..... : -
Two pass 6502 assembler.

- EASMD (disk)
version, year : 1.0, 1981
author/company : OSS
available..... : ?
package..... : assembler, editor, monitor
features..... : ?
Two pass 6502 assembler with integrated editor/monitor.

- Fast Assembler (disk)
version, year : 1.5, 1995
author/company : MMMG Soft
available..... : ?
package..... : assembler, editor, disassembler
features..... : ?

- Kasm65 (disk)
version, year : 2.41, 1994
author/company : Ken Siders
available..... : shareware, umich
package..... : assembler, editor, linker, docs
features..... : macros, relocation, source include,
conditional assembly
Two pass 6502 assembler. Relocatable object files are
compatible with ra65. Source format is derived from
the Atari Macro Assembler.

- MAC/65 Macro Assembler (disk|cart)
version, year : 2.00, 1982
author/company : Stephen D. Lawrow, OSS
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : macros, source include
Two pass 6502 assembler with integrated editor/monitor.
Mac/65 is a direct descendant of the Atari Assembler/
Editor (via EASMD).

- MAE (disk)
version, year : .96, 1996
author/company : John Harris

available..... : umich
package....... : assembler, menu, editor, monitor, docs
features...... : macros, source include, data include,
conditional assembly
Two pass 6502/65816 assembler with integrated editor/
monitor. Extra RAM supported.

- NASM65 (disk)
version, year : ?, 1992
author/company : Nat!
available..... : ?
package....... : assembler, linker, librarian
features...... : macros, relocation, source include
One pass 6502 portable cross assembler (initially for
the ST). Highly compatible with MAC/65.

- PC-65 (disk)
version, year : 1.0 beta, 1996
author/company : Jan Feenstra & Freddy Offenga
available..... : mailto: F.Offenga@student.kun.nl
package....... : assembler
features...... : macros, source include, data include,
boundary directive
Two pass 6502 cross assembler for the PC. The source
format is highly compatible with the ST-65 assembler.

- Quick Assembler (disk)
version, year : 1.0, 1990?
author/company : JBW, Avalon?
available..... : ?
package....... : assembler, editor, menu, debugger
features...... : source include
Two pass 6502 cross assembler with integrated editor.
Very user friendly menu environment.

- Ra65 (disk)
version, year : 1.0, 1989
author/company : John R. Dunning
available..... : public domain, umich
package....... : assembler, linker, librarian
part of cc65 (c-compiler)
features...... : ?

- Synassembler (disk|cart)
version, year : ?, 1982
author/company : Steve Hales, Synapse Soft
available..... : ?
package....... : assembler, editor, monitor, manual
features...... : source include
Two pass 6502 assembler.

- ST-65 (disk)
version, year : ?, 1991
author/company : A. Stauffenberg, F. Offenga
available..... : mailto: F.Offenga@student.kun.nl
package..... : assembler, menu shell, manual
features..... : macros, conditional assembly,
source include, data include,
boundary directive
Two pass 6502/65c02 cross assembler for the Atari ST
written in 68000 assembly. As far as I know this is
the first assembler with the boundary directive.

b) BASIC

- A BASIC Compiler (?)
version, year : 1.03, ?
author/company : Monarch Data Systems
available..... : ?
package..... : BASIC compiler
features..... : ?

- Advan BASIC (disk)
version, year : ?, ?
author/company : Advan Language Designs
available..... : ?
package..... : BASIC compiler
features..... : ?

- Atari 800 Basic (disk)
version, year : 1.0, 1981
author/company : Microsoft
available..... : ?
package..... : ?
features..... : ?

- Atari BASIC (cart)
version, year : Rev.C, 1983
author/company : Atari
available..... : standard ROM in Atari XL/XE
package..... : BASIC interpreter, manual
features..... : pretty plain BASIC implementation

- Atari Microsoft BASIC II (cart)
version, year : ?, 1991
author/company : Atari
available..... : ?
package..... : BASIC interpreter
features..... : ?

- BASIC A+ (disk)
version, year : 3.05, 1981
author/company : OSS
available..... : ?

package..... : BASIC interpreter
features..... : ?

- BASIC XL (cart)
version, year : ?, ?
author/company : OSS
available..... : ?
package..... : BASIC interpreter
features..... : ?

- BASIC XE (cart)
version, year : ?, 1985
author/company : OSS
available..... : ?
package..... : BASIC interpreter
features..... : ?

- Turbo Basic XL (disk)
version, year : 1.5, 1985
author/company : Frank Ostrowski, Happy Computer
available..... : ?
package..... : BASIC interpreter, compiler (V1.1)
features..... : ?
Published in the German magazine "Happy Computer".

c) C

- ACE C (disk)
version, year : ?
author/company : John Palevich & Ralph Walden
available..... : ?
package..... : ?
features..... : ?
This is a newer version of 'Deep Blue C'.

- C/65 (?)
version, year : ?
author/company : OSS
available..... : ?
package..... : ?
features..... : ?
Probably derived from Dr.Dobbs "Small C". Compiles to 6502
code which emulates the 8080 instruction set.

- C65 (?)
version, year : ?
author/company : Keith Ledbetter
available..... : ?
package..... : ?
features..... : good macro assembler
This compiler does not support structs.

- CC65 (disk)
version, year : 1989
author/company : John R. Dunning
available..... : ?
package....... : compiler, linker, assembler, librarian
features...... : ?
Public domain compiler. Also used as cross compiler.
Relocatable object linkage files, and the most thorough
K&R C for the 8-bit. Comes with an relocatable assembler.

- CC8 (disk)
version, year : 2.3
author/company : John Palevich & Steve Kennedy
available..... : ?
package....... : Compiler
features...... : ?
ACE C with more "real" C support (e.g. arrays of pointers
to structs). Requires ACE C runtime libs and linker.

- Deep Blue C (disk)
version, year : 1.2, 1982
author/company : John Palevich, APX
available..... : ?
package....... : Compiler, Linker
features...... : ?
Deep Blue C was originally an independent product, but it
then became available from APX. It converts C to pseudo-
code and then interprets the pseudo code (8080 instruction
set emulation).
Drawn from Ron Cain's public domain C-compiler (Small-C).

- DVC C (disk)
version, year : 1.05, 1985
author/company : Ralph E. Walden
available..... : ?
package....... : Editor, Compiler, Optimizer, Linker
features...... : Quite user friendly program
The compiler generates special object files (.CCC)
which can be optimized and linked. The package uses a
special DOS called DVC DOS which contains runtime stuff.

- LightSpeed C (disk)
version, year : 1.08, 1986
author/company : Clearstar Softechnology
available..... : ?
package....... : Compiler, Optimizer, Linker
features...... : ?
Runs under CLI DOS's and MENU DOS's.

- Tiny-C
version, year : ?
author/company : OSS
available..... : ?

package..... : ?
features..... : ?
First sold C compiler by OSS. This compiler was used to
compile itself! First true language "bootstrap" on any
8-bit machine (it was also available for Apple and CP/M
machines). Derived from Dr.Dobbs "Small C". Compiles to
6502 code which emulates the 8080 instruction set.

d) PASCAL

- Atari Pascal (disk)
version, year : 1.0, 1982
author/company : APX
available..... : APX-20102
package..... : ?
features..... : ?

- Draper Pascal (disk)
version, year : 2.1, 1989
author/company : Norm Draper
available..... : ?
package..... : ?
features..... : ?

- Kyan Pascal (disk)
version, year : 1986
author/company : Kyan Software, APX
available..... : ?
package..... : editor, compiler, linker, macro-assembler
and manual
features..... : ?
Kyan Pascal would run off a single floppy. The Atari (APX)
version needs two drives. A version which runs entirely in
128k should be available too.

e) LISP

- INTER-LISP/65 (disk)
version, year : 2.1, 1981
author/company : Special Software Systems, DataSoft
available..... : ?
package..... : ?
features..... : ?

f) FORTH

- ValForth (?)
version, year : ?
author/company : Valpar International
available..... : ?
package..... : ?
features..... : ?

- Extended fig-Forth (?)
version, year : ?
author/company : APX
available..... : APX-20029
package....... : ?
features...... : ?

- fig-Forth (disk)
version, year : 1.4s
author/company : ?
available..... : ?
package....... : ?
features...... : ?

- fun-Forth (?)
version, year : ?
author/company : APX
available..... : APX-20146
package....... : ?
features...... : ?

- Grafik-FORTH
version, year : ?
author/company : ?
available..... : ?
package....... : ?
features...... : ?

- QS Forth (?)
version, year : ?
author/company : Quality Software
available..... : ?
package....... : ?
features...... : ?

g) PILOT

- Atari PILOT (cart)
version, year : 1980
author/company : Atari
available..... : ?
package....... : ?
features...... : ?

h) LOGO

- Atari LOGO (cart)
version, year : 1983
author/company : LCSI, Atari
available..... : ?
package....... : ?
features...... : ?

i) All the rest

- Action! (cart)
version, year : 1983
author/company : OSS
available..... : ?
package..... : compiler, editor, monitor and library
features..... : fast compiler which generates good code
Needs cartridge for runtime procedures. A PD runtime
library is also available.
All variables are static, so recursive routine calls
are not possible. No floating point type (though a
PD library should make this possible). No arrays of
objects (arrays of POINTERS to objects are possible).

- Quick (disk)
version, year : 2.0, 1990
author/company : Raindorf Soft
available..... : ?
package..... : ?
features..... : ?
This is the "poor man's Action!". Same restrictions as
Action! apply also to Quick. Further restrictions are:
only simple assignment expressions, no records and no
pointers.

- Test Computer Language (disk)
version, year : 2.2, 1985-1990
author/company : D.Firth
available..... : public domain, ?
package..... : compiler and editor
features..... : ?

Subject: 13.14) What is the Atari XEP80 Interface Module?

This section written by: mailto:raukamp@dame.de (Thomas Raukamp)

Since the development of the Atari 8-bit line of computers in 1979, users
wanted better text displays than the default 40x24. There has been some
attempts to satisfy this need, like the Austin-Franklin board or the Ace
80/80xl cartridge. For more informations about these modifications read The
Atari 8-bit Hardware Upgrade FAQ from mailto:david_p@storm.ca (David A.
Paterson)

The Atari XEP80 Interface Module is Atari's entry to the 80 column field. It
lets a XL, XE, 400 or 800 computer system display a full 80 columns across
your monitor screen. The XEP80 provides a 256-character wide by 25-line
display window. Up to 80 characters are displayed horizontally at once, and
you can scroll horizontally all the way to the 256th character, depending on
the application you're running. The XEP80 is connected to your system via a
joystick port.

The XEP80 Module interprets commands from the computer for screen display or
output to a printer. The module is supplied with an industry-standard 8-bit

parallel port so you can connect a parallel printer to your Atari 8-bit (I even use a HP LaserJet IV on my 130XE ;)).

All programs that use the standard screen call (E:) should be compatible with the XEP80 Module. The software provided by Atari supports a 320x200 graphics mode - this mode only support direct bit images. Note that you can't use all of the standard graphic capabilities of the Atari anymore.

Although Atari recommends a monochrome monitor for usage with the XEP80, it runs fine with any type of composite monitor. The output looks great on my Commodore 1084 for example.

Along with the module comes a software-package containing an AUTORUN.SYS file, which is the XEP80 handler. If you want to use the module with an application that is compatible with the XEP80, which has it's own AUTORUN.SYS file, you can append the application's AUTORUN.SYS on the module's AUTORUN.SYS.

Subject: 13.15) What makes some XL/XE software incompatible with the 400/800?

Konrad M.Kokoszkiewicz, mailto:draco@mi.com.pl writes:

XL/XE software won't work on 800 if:

1) it uses shadow RAM at $C000-$CFFF and $D800-$FFFF
2) it uses RAM expansions at $4000-$7FFF controlled by PORTB $D301
3) it uses specific XL OS functions (like JNEWDEVC)
4) it uses illegal XL OS addresses.
5) it uses European Charset :)

Subject: 13.16) What games run only on the 400 and 800 models?

The following are reported as incompatable with models other than the original Atari 400/800. Most probably do work on XL/XE's if you use a translator to run the original 400/800 OS on your XL/XE.

Apple Panic Broderbund

Subject: 13.17) What games make use of the Light Gun?

mailto:jmouchmino@aol.com (Bertrand M. (LEXX)) writes:

Bug Hunt, Barnyard Blaster, Crossbow, Crimebuster, Operation Blood, Operation Blood II - Special Forces (not completely sure about that one), Light Gun Blaster (PD), Gangsterville (Italian game written in BASIC), maybe a couple

more...

Bertrand M. (LEXX)

James Bradford mentions:
"On the 400, the light gun /pen will only work in joystick port 4." This
renders much light gun and light pen software unusable on the 400.

Subject: 13.18) How do I type a tilde (common character in Web URL's) on my
Atari?

The Shadow, mailto:The_Shadow@spnt.com writes:

The question is: "How do I type the tilde or squigly line which is in
most web addresses? I don't have a key for it..."

Answer: The tilde is an inverse backspace on the Atari 8-Bit which can
be very hard to type depending on the term program you are using,
however you can insert the hex equivalent very easily, which is %7e in
place of the tilde and it will work just perfectly. Do not put a space
either before or after the %7e.

I (Michael) add:

Some advanced Atari software supports the tilde character natively. E.g.,
you can type a tilde in Ice-T with the Atari Logo/Inverse Video key.

Subject: 13.19) What's the difference between ASCII and ATASCII?

David Moeser -- erasmus att iglou dott com -- produced this nice translation
table.

ASCII TRANSLATION TABLE -- IBM & ATARI 8-BIT (ATASCII)

Hello Richard,
why not use Tom Hunt`s A8 Wave player ?!? It plays back Windows wave-sounds on a standard or extended 8-Bit Atari. It supports up to 1 Megabyte extension Ram and works great under Sprata DOS (yet not so good under DOS 2.x). Ok, this little thing (called the CTH Sound Utility) can of course not play back the Wave-Sounds in its original form (16 Bit, Hifi-Stereo, CD-quality/44,1khz, etc.) but it does its job quite good on the little Atari...

Solution: For an A8 internet browser you would need some sort of environment, like a GUI or so, that can detect which extensions (plug-ins) are needed and when they are needed. For example to "read" and display HTML text on the A8 it would load any HTML to ATASCII converter/displayer and thus present the text in a much simpler but still readable form. If you click on a "button" for any sort of picture (GIF, JPG, etc.) then the environment system would close the HTML converter and load any picture converter to display that picture (a GIF converter for GIFs, a JPEG converter for JPGs, etc.) in an A8 typical form (smaller resolution, less colors; interlaced or non-interlaced, etc.). If you would click on a sound button, the environment (or browser) would then load any sort of sound converter, to play back that sound in an A8 sound form. And so on...

In short: The browser would need an extended Atari (eqipped with Ramdisk) and would load all nescessary extensions/plug-ins from extended RAM/Ramdisk, whenever it needs them. But finally, I am not sure if this concept (just an example!) could be realised on an A8 (i.e. you would need enough Ram to have at least 3 things working: the environment/ the

browser, the appropriate converter program and lastly the actual text/sound/graphic). Maybe someone finds an easier way and someday we really have an internet browser for the A8 avaiable, who knows ?!?
greetings - Andreas

4160. Wet Floppies!

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-06 00:00:00 UTC
From: nperfect@aol.com
Message-ID: <20000706160630.12695.00001230@ng-fg1.aol.com>
Source record: 43627

Hello All
My entite collection of 200 odd Atari 5 1/4 floppies got soaked after a bit of a flood.
Essentially just rainwater so what to do?
The inner friction lining seems to be like a thin tissue or sponge and as it is enclosed in a presumably impervious plastic case, will they ever dry out ?
And even if they do, are they likely to be still usable after their bath?
I suppose I could cut them out and put them in new jackets but what a task!
and a shame to lose the original packaging.

Any help gratefully received

/\/ick

What we would need is some sort of proxy software, that "downgrades"
HTML to something the A8 could use. It changes the Jpegs, Gifs, and PNG
to a simple graphic format for the A8. Much like the Top Gun browser for
the Palm (and the Palm screen is 4 shades of gray, with a resolution of
something like 160X160.... Sound familar?)

Then you just have to modify the proxy server to handle the different
types of media... Although I don't know what you would do with any of
the multimedia (Quicktime, MPEG,...) formats!!

Body handling: HTML body converted to readable text

For faster service, Please direct all replies through E-Mail to Ben at: atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I find it hard to keep up with NewsGroups.

I update my catalogs once a week. Just before this message is posted. So when you see a new posting, check my Catalogs. After I post this message. I'm off for the weekend. But I'll be back after the weekend.

If your looking for my Free catalogs, skip to the bottom,otherwise read on. I've added new items to my Catalogs, including, for the first time, ST Hard Drives, SyQuest 88 Meg removable Hard Drive, Software, Books, Light Pens, Atari Touch Tablet and some Cartridges for the ST like DVT VCR Hard Drive Backup, ST Replay & Computer Eyes! So come and Get it!

e-mail: atari@benjamin.net

To take advantage of Discounts, FREE Monitors or FREE Jaguar Cable, you must E-Mail me to Claim it & state what you want in E-Mail.Be specific!

Discounts! Buy now! 5% Discount with a $50 Purchase. 10% Discount with a $100 Purchase. 15% Discount with a $150 Purchase. And a 20% Discount with a $200 Purchase. Discounts Apply to Classic Atari 8 Bit, Atari ST and/or Atari Jaguar. Hardware, Software, Books & Accessories! Shipping not figured into Discount.

FREE Monitor with Atari Purchase! Buy either an Atari 1040STF, Mega ST2 or 1040STe & receive a FREE ST Monitor. Your Choice of a Color or Mono-Chrome Monitor. FREE Monitor when purchasing an Atari 8 Bit Computer. Buy an Atari 800XL or a 130XE and receive your choice of any Monitor in the Atari 8 Bit Hardware Catalog. And FREE when purchasing $50 worth of Atari Jaguar items, receive absolutely FREE, a +NEW in the BAG Jaguar Stereo Audio/Composite Video Cable.

Offer Available for Limited Time only. First Come, First Serve! Subject due to availability! Customer pays Shipping! Substitutions considered.

I've added more and will be adding more Hardware, Software, Books and Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out into Atari Jaguar Hardware & Games. So checkout what's new on my Web Site. In Fact, check it regularly as my Catalogs are updated regularly. Customer's are served, first come, first serve! No competing in auctions. Just Sales, Support & Service! I have 8 different Catalogs, & my SoftWare Catalogs are my largest. They have the biggest Byte Count. You should see my inventory! I have TruckLoads of HardWare, Boxes and Boxes of Software & Libraries of Books & Reference Material for the

Classic Atari 8 Bit, Atari ST & Atari Jaguar Game Machine! And
remember, if you can't come see me today, come see me tomorrow!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari
64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories!
View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump
to my FTP site linked to my WebSite so you can Download Free Catalogs
or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's not an inconvenience. I do ask that you specify
Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you
by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can
attach text files to your E-Mail. Catalogs are just regular ASCII text
files so you can download them into your text editor & view them, edit
them or print them out! It would make things easier for me if you take
my Catalogs, load them into your text editor, delete what you don't
want and E-Mail me the rest! To expedite things, include your complete
Mailing address so I can figure your Shipping/Postage & Handling. I'll
be back after the weekend.

If they were badly soaked, like submerged, they may be gone forever.

> The inner friction lining seems to be like a thin tissue or sponge and as it
>is enclosed in a presumably impervious plastic case, will they ever dry out ?

Even that might not help. I had a similar experience with some 3.5
floppies, and nothing seemed to work. You also need to be wary of
ruining the disk drive you test the floppies in.

Hi,

I can make your upgrade a lot easier, I have a spare Atari 1064 64K
Memory module which plugs into the expansion bus on the back of the Atari
600XL and upgrades it to a full 64K.

>What we would need is some sort of proxy software, that "downgrades"
>HTML to something the A8 could use.

Er... strictly speaking, the inline images are NOT part of HTML,
but they are rather "embedded" into it...
And besides, HTML doesn't force the browser to anything but
to recognize the tags and syntaxis; how the browser interprets
them depends on the designer's taste...
In other words, no matter what they say, HTML is >NOT< to be
thought of as being WYSIWYG, but rather more like YMMV.
So you don't need a proxy, just a browser that knows what to
do on an A8!
> It changes the Jpegs, Gifs, and PNG
>to a simple graphic format for the A8.

Actually, those formats were designed having in mind they would
need to be displayed on different computers with different graphics
capabilities... the only thing needed is an algorithm implementation
that will work at the resolution and number of colors you decide to
use.

> Much like the Top Gun browser for
>the Palm (and the Palm screen is 4 shades of gray, with a resolution of
>something like 160X160.... Sound familar?)
>
That would be interesting to see! (GR.15 with text window has
that same resolution, and its 4 colors can be made 4 shades of
grey... say 00, 05, 0A and 0F
(or, you could choose black, red, green and blue and combine
them... 3 adjacent pixels making one dot? It works giving 8
"colors"... trust me, I've tested it)

>Then you just have to modify the proxy server to handle the different
>types of media... Although I don't know what you would do with any of
>the multimedia (Quicktime, MPEG,...) formats!!

Just ignore them putting a comment like "[QuickTime Movie here]";
as I said, HTML leaves open how the browser handles tags...

This might sound like a silly suggestion, but...

Try calling a forensics lab.

I've seen (probably on Discovery Channel) how they toke a damaged 5.25 inch disk (it was cut into pieces like a pizza, but not with a strait pair of scissors, but by these 'kindergarden scissors' that give you edges that look like this: /\/\/\/\/\/\/\/),somehow put the pieces back together and were able to retrieve most, maybe even all, of the data. And used it as evidence to find and catch their killer.

You'll ofcourse have to do the repairing yourself, but they MIGHT be able to tell you how it's done.

Try best Electronics. (how to contact them is in Michael Current's FAQ's)

If they don't have them (which I dought (sp?)) and places like the ratshack
don't have them, try small computer stores (where they now how solder smells)
or if you can find one, a place that recycles computers.

For those that have XL or XE computers:

There is a CD ROM driver for the BlackBox. Unfortunately, it only does audio
CD's at the moment.

The MSC-IDE controller will handle both data and audio CD's.
(www.birmanns.de iirc)

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

4175. The Fuji Handheld Computer Project

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-07 00:00:00 UTC
From: Chris Martin <cmartin@ti.com>
Message-ID: <396668FA.5AB92921@ti.com>
Source record: 43642

Hi All!

Some of you have already been monitoring this thread under the subject,
"bring back atari", and I have promissed to break this out into a whole
new discussion. So, here we go....

For all those who are interested, here is the rough run-down of the
project:

I, Rick Cortese, Robert Cortese, Peter Laing and others have recently
started a hardware/software project whose goal is to build a portable
handheld Atari 8bit clone. Right now, the idea is to port the Atari800
Emulator to the TI c6211 DSP (which will be at the core of the design).
The hardware will include the DSP and an LCD (and hopefully a serial
and parallel port among other things as well in the end).

This project is still in the planning stages, so this is an open
invitation
to all that want to help with the software and/or hardware. I just have

one question:

Does anyone want to lend a hand on this project?

If the answer is yes, I have registered a project with
sourceforge.net and you are more than welcome to join. To do so, check
out the following:

If you do not already have a sourceforge.net account, you will need to
get
one. In order to register a new account with sourceforge.net, click
here:
https://sourceforge.net/account/register.php

Then, request to be added to the project by going here:
https://sourceforge.net/developer/index.php?form_dev=46772

Things we are currently looking for:
(1) schematics for the 800XL or the 130XE or both. (I am
not sure how relevant these are to this project, but
I would like to have them all the same... :-)
(2) Anyone who may be familiar with the Atari800 Emulator
who is willing to work on porting it.
(3) Anyone who has access to TI DSP tools. (I do, since I work
at TI, and am working on a way to allow others easy access to
these tools, but if you already have access, even better......)

Any comments and suggestions are more than welcome!

Thanks,
Chris

Hello, I am auctioning a brand new copy of the original Frogger computer version by Sierra Vision unopened!!! This is NOT the later rerelease, it is the original Sierra Vision version, dated 1981. I have a pic in the auction if you'd like to look along with further details. And I have plenty of other classic disk based games up for sale too (most start under $10), including some very cheap grab bag lots of 40-100+ boxed games for only $100 shipped. Please check the auctions (all have pics) , you might see something you like, doesn't hurt to take a peek, you don't have to bid :)

What if CBM and Atari merged? Do you think this would have been a good thing?

4182. An atarian once more!

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-08 00:00:00 UTC
From: John Dickson <JMDickson@home.com>
Message-ID: <3967479E.DFDE53C2@home.com>
Source record: 43551

Hey!
I just got a 800 and 130XE, nine years after my original 800 died. Neither machine is in mint condition, the 800 only randomly awards me with the BASIC 'Ready' prompt about every fifth power up, and the 130 doesn't register 2 columns of keys.
I started with the 130 since that seemed to be an easier repair. I've checked the plastic sheet under the keys, and don't see any scratches in the traces. Silly me has misplaced my multi-meter, but when I find it I'll check that out better. Any suggestions where to go next if that doesn't turn out?
The systems came with several peripherals. I have an interesting SIO-RS232 cable. It has a black box open on one end with a SIO socket. I can see the circuit board, but cannot make out the chips. On the opposite end there is a black SIO cable beside a gray 25-pin sub D. To make sure this was not a parallel printer adapter (already got another one in the deal) I disassembled the 25-pin plug. I found TX,RX,GND, and RI connected like an SIO2PC, but also DCD and DTR. My question is has anyone ever tried to use one of these as a SIO2PC adapter? If not does it sound possible that it would work?

Thanks,
John

4184. Warning! -- SONY SUBSTANDARD SERVICE

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-08 00:00:00 UTC
From: An_American_Consumer@sobhij.net
Message-ID: <F6DDB747F.esbwygrcd@pbqefs.org>
Source record: 43553

Anyone considering the purchase of a Sony peripheral for their computer might want to give it some further thought. There clearly is not a reciprocal relationship between what they sell and what they service.
-
I purchased a CD-RW drive back in April that just recently went bad (won't read). When I called Sony service, I was told that I could not get a replacement and that I had to ship it across the country to be "repaired" (and we all know what that means...) - with a three (3) week turnaround. Assuming that they keep their 3-week commitment, with shipping both ways, I'd be without the use of the unit for at least five weeks!!!
-
I hardly think that's reasonable or fair.
-
Compare this to HP, who under the same circumstances would simply ship you out a replacement unit and issue a call-tag for the old one.
-
Sony is a behemoth in the marketplace and as such, they have an obligation to scale their service facilities to meet demand. To not do so is an indication of their lack of commitment to customer satisfaction and an unwillingness to stand behind their products.
-
Buyer be ware!
-

Well, the 130 does have a bad membrane. The trace has a bad spot near
the connector. Does anyone know you to repair these plastic sheets? I
tried using metal foil to make the connection, but there is not enough
pressure to make good contact. Is there a way to get a replacement?
It's marked Mitsumi 56-3217A.

Thanks, John

you can try the 'paint' that auto stores sell for fixing rear window defroster 'paint' electric connections. It is expensive, but will usually work, and a small bottle lasts a long time.

My little girl wants to build a robot, and the idea intrigued me. I am wondering what computer to use. I have an old Acer Aspire 75MHZ machine that WAS about to go in the trash. But I grew up with an Atari. I know nothing about the PC. I know a little Visual Basic and thats it. I know my way around the Atari a little better and feel like I would have a little better luck with it. The things I can see that the Acer would benifit me on is speed, RAM and harddrive compared to the Atari. Which do you all recommend? Also, if Atari, should I go with 2 joystick port or 4? I do like the idea of a 130XE with 4 megs of ram, but would giving that up for 4 ports be worth it? And what about the expansion slot? Any and all input wanted and appreciated.

Build BOTH robots! Both are good machines for this, the Atari because of
the joyports, and I can tell you how to access the joyports and stick
ports if you need, or the parallel and game port on a PC. Both offer
about the same basic I/O, so do whatever you like. Write me if you want.

If you e-mail me I can try to give you a little more detailed help
than is possible here =) Make sure your computer has 16550 or better
UART's, these are required to use APE'98 properly.

If your computer does have 16550 uarts let me know, I will try
to help you find the problem. If you do not have modern UART's, try
running the DOS version of APE, it should work better with older serial
hardware, even under windows.

I believe PP2 contains on program roms, Atari style with the
high address lines swapped for chip select. It's been a long time
since I dumped 7800 carts so I could be wrong here.

Some other 7800 carts contain interesting goodies. Some have
an 8k SRAM. Ballblazer actually contains a POKEY chip, which is
an easy way to get a quick replacement or an extra for a GUMBY upgrade.

and as it

You may be suprised to find how durable Atari disks are in the fact they can often be read after flooding, heating by sun, and many years of total neglect.

First, let all the disks dry out completely. Then open up a disk drive like a 1050 so you can get access to the read/write head. Start trying to read the newly dried disks one at a time and copy them to disk images or new disks.

Between each backup, clean the read/write head with a foam swab and a little alcohol, letting it dry completely for a few seconds before putting in the next disk.

Should any disks by difficult to read do the following.

1. Cut the disk out of its old sleeve using a razor or sizzors, being careful not to damage the disk itself.

2. Cut open a brand new 5.25 disk along the edges so you can open it to remove the blank disk, yet still be able to get it into a disk drive.

3. Take the unreadable floppy insides and gently rub both sides with a clean damp cloth and allow to dry completely.

4. Put the newly cleaned disk innard into the new disk sleeve, close up and insert carefully into the drive for backup.

Most unreadable Atari disks can be recovered this way. It works expecially good on disks that have that scratchy adhesive rot that gunks up the inner sleeve and disk with magnetic dust. Some disks you couldnt read a single sector off of in the old sleeve will read perfetly fine in the new one.

I believe Best still sells replacement keyboard mylars for the 130XE.
They are not cheap but well worth the cost of recovering an otherwise
pefectly sound computer.

> The systems came with several peripherals. I have an interesting
> SIO-RS232 cable. It has a black box open on one end with a SIO
socket.

You may have found an R:Verter interface. These are very similar
in nature to SIO2PC interface on the data lines. Assuming you could
wire /COMMAND to RI or DSR, disconnect the other control lines, and
convince the cable to be 'open' all the time, it should work fine.

Some people use Nickel Print, which you can get in electronics supply houses. You have to really shake it, since the mixture separates easily on standing, use a very fine brush or mask it very carefully with tape, and really let it dry.

Others have had good results with the stuff you repair rear window defrosters with. I imagine the technique is similar.

Sometimes the mylar sheets are available from places like Best Electronics and B&C Computervisions.

Steve's right. The first thing you'll find out about doing robotics is that EVERYTHING is useful. Its half the fun to think up things to do with the stuff around the house, at garage sales, in the sale bins, at second hand shops etc. The best way to learn about something is to take it apart, put a probe on it and push some buttons. I think you'll be surprised at how much you'll learn about pc's by playing with the Acer. Experiment. Oh, and read this group! The world begins to look like a new place when you begin to build your first robot. Have fun with your daughter as she thinks up new possibilities for everyday things. Many of the best solutions on this group have come from the youngins.

4208. Help - Atari 1027 Print Head

Newsgroup: comp.sys.atari.8bit

Hello,

I've got a working Amiga 3000 (tried comp.sys.amiga.marketplace or whatever it is, but no takers there...) with 40 meg SCSI, OS 2.1, 2 meg fast RAM, 4 meg chip RAM.
includes keyboard and mouse, and a 25-pin to 9-pin adaptor cable which i used for the 15khz video out to a commodore 1084S (sorry, i'm not selling the monitor).
I also have a (not installed or tested) 500 meg SCSI drive that i'll throw in, if you want to mess around with it..

I'd like to trade for any Atari computer equipment / software, Apple II stuff, Mac stuff, old synths, or anything like that... or maybe a trade + cash... i'd rather do this than sell my soul to EBAY :)

email me with any offers or questions!!

nick bellando

>
> -Chuck

Well, the atari is limited in the processing power that is available to
you. But some people have built robots that use 2K of program memory on
a 1MHz microcontroller. The Acer would be a better choice depending on
how big your robot is going to be. The power supply is more complicated
as well because you need to provide a variety of different voltages (+5,
+12, -5, -12, and in some cases +3.3). For interfacing, a joystick port
makes a good input to a computer, but not a good output. The Acer would
be better in this reguard because there are specialized boards that are
available that plug into an expansion slot that will interface the
computer to various digital and analog inputs and outputs with far
better persision and accuracy that a joystick port. Check out
JDR-Mircodevices at http://www.jdr.com/interact/default.asp for
information on real world interfacing boards. Look under industrial
products.

Reprinted from Atari Classics, Vol. 1, No. 1, December 1992

Tips 'n' Tricks

1027 Ink Rollers: Good news for anyone still using the Atari 1027 letter-quality printer. Our Managing Editor recently obtained a replacement 1027 ink roller from B&C ComputerVisions and is pleased to report their latest stock of this item appears to be fine.

During the period 1989 to 1991 many vendors--including Atari Corp. itself--had acquired defective lots of these rollers. The defectives were easily identified by the fact that they quickly disintegerated, flinging bits of ink-laden material everywhere as the roller turned; it was also easy to scoop out a chunk of the spongy roller with a fingernail. The latest available stocks have a tough roller surface that doesn't come to pieces with use and will hold up to several rounds of re-inking. Better stock up!

I believe Best (and probably others) had them:
http://www.best-electronics-ca.com/

If the roller is still supple and not brittle, you should be able to re-ink it with stamp pad ink or othe suitably thick ink.

-Ron

I don't have a solution but I admire the problem.

That's no lie. I've been letting my kids tear apart stuff and they learn
a lot and have fun. Then I try to figure out how it works, which is a lot
of fun. Then I wonder what to do with it, and the kids never fail to come
up with interesting ways to put stuff together.

I've got more scrap than I know what to do with right now, but I don't
think it'll be long before I'm doging stuff running around the house
and back yard.

The hard part is remembering I've got to go to bed eventually and get some
sleep. Too much fun isn't always good :-)

Patience, persistence, truth,
Dr. mike

If you don't want to spend a lot of time on it, the PC clone wins for simple applications. Atari joysticks are designed to be idiot proof, something like 220 or 800 Ohm resistance inline, on reset are configured for input, that kind of stuff.

A PC printer port can usually drive a couple of mamps out of each data bit, it also comes with something like 4 input lines. For simple stuff like driving a transistor to turn on a hobby motor they are perfect, probably drive just about any GP transistor.

As far as diving it goes, you should just be able to print characters to the port. Not sure about handshaking lines and where they have to be tied, but it should be as simple as printing chr$(65) to get a 65 binary to appear at the port.

>interface and the software, but no documentation. Someone has removed the >sio
cable from the interface. I have a loose sio cabled, but no map to connect it
with.

Lee;
Opened up the P:R: to trace the wiring; lo & behold, ICD has it well
engineered. The printed circuit board has the SIO pin numbers marked right on
the pcb and the plug is in parallel to the onboard jack beside it.

This site should have the pin outs:
http://www.dial.to/atari

The pin numbers sawtooth from #1 lower left to #13 lower right. The plug is
mirror image of the jack. Here is the jack:

```
2 4 6 8 10 12
o o o o o o
o o o o o o o
1 3 5 7 9 11 13
```

-Ron

I don't have a solution but I admire the problem.

4235. 130XE Keyboard Probs

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-10 00:00:00 UTC
From: David Montgomery <dmontgomery@mediaone.net>
Message-ID: <gM9a5.8659$PU5.49569@news1.southeast.rr.com>
Source record: 43590

I recently discovered APE and I'm attempting to revive my old 130XE which has been sitting on a shelf in my computer room. I'm having some keyboard problems which I've traced to some "broken" traces on the keyboard membrane (I seem to remember having these problems 10 years ago when I last used the computer). Basically, some of the metallic "stuff" has been rubbed off and the trace is broken. So, my question is what is this metallic "stuff" and how do I fix the trace. Any suggestions are appreciated.

Thanks.

David

These guys just helped me with the same problem. The first post I
received recommended using a rear window defogger repair kit. For $10
at an auto parts store you get a .05 oz bottle, a little brush and a
sticker mask. The mask was way too wide, so I fashioned a new one with
scotch tape and a razor(those are pretty small traces in some places!).
Three coats and five minutes that thing works good as new! I also fixed
my defogger on my car!
If you make your own mask, stick it real good, because this stuff will
flow under it, I had to scratch some off.

Nickel Print from an electronics supply store was also recommended,
but I was already finished when I got that post.

I have 7 SIO devices and am working on an SIO2PC. Of course I don't need all of those at once, but how many of these can be chained reliably? Also, is there anywhere to get an SIO socket, I'd hate to cut up a cable if I didn't have to.

Thanks,
John

9V AC Atari supplies are around quite a bit, they used them for almost
everything. If you can't find an Atari, and 9V AC that delivers ~1.5 amps
should be good enough for a 1200XL, but 3 amps would be better.

Easiest thing is to buy the Lego Robot kit(s) and use the PC. They're not
cheap but you can do a lot with them and even create autonomous devices
that get on with it themselves. You build the robot, write the code in
either VB or via custom lego drag & drop software then download it to the
CPU brick.

Saw a demo at a trade show of a lego robot that climbed up and down a wall
whilst finding other bits of robots, identifying them, connecting to them
and then moving on as a new bigger robot.

I'm having a clear-out of Atari 8-bit disks and I have the following items
for sale (all items are originals with packaging and instructions).
All prices are in GB Pounds:

ACE OF ACES, US Gold, 2.50
ADAX, Avalon, 2.00
BOMB, Ke-Soft, 2.00
BOMBI, Power-Per-Post, 2.00
BOP 'N WRESTLE, Mindscape, 8.00
DARG, B.Ware, 1.50
DEMO MAKER & EDIT 7, DGS, 2.00
DIGI-STUDIO, DGS (4 disks), 4.00
DRACONUS, Cognito, 2.50
EUREKA, ANG Software, 2.00
EUROPEAN SUPER SOCCER, Tynesoft, 2.50
FIRST XLENT WORD PROCESSOR, Ke-Soft (German Inst.), 2.50
GLAGGS IT, Power-Per-Post, 2.00
HANS KLOSS, Avalon, 2.00
HAWKQUEST, Red Rat, 9.00
HUMANOID, Sonix, 2.00
INSIDE, Spektra, 2.00
JAWBREAKER/MOUSKATTACK, R Gore, 2.00
KE-COMMANDER, Ke-Soft, 2.00
KULT, Tiger Dev, 2.00
LASER HAWK, Red Rat, 2.50
LITTLE DEVIL, Red Rat, 2.50
LIZARD, Tiger Dev, 2.00
MAXWELL'S DEMON/MEMORY MANIA, Gentry (Tatty Box), 1.00
MIDNIGHT, Mirage, 2.00
MINES, ANG, 2.00
MINESWEEPER, Power-Per-Post, 2.00
MIRAX FORCE, Tynesoft, 2.50
MISSION ZIRCON, Tiger Dev, 2.00
NIGHTMARES, Red Rat, 2.50
PLASTRON, Harlequin, 2.50
QUICK + QUICK SUPPORT DISK, Power-Per-Post (A4 manual), 3.00
QUICK ED, Power-Per-Post, 2.00
ROBOMASH, TWAUG, 2.00
RUBBER BALL, Power-Per-Post, 2.00
SAM BUDGET, Power Per Post (Requires SAM), 2.00

Hello Daniel,
how about the "Mindstorm" project from Lego ?!? Well known all around
the world !! For the A8 there have been some interfaces or add-ons
avaiable to use Lego and/or Fischertechnik toys and control them via
computer. Of course you could built a robot arm or a complete robot, but
nowadays ist very hard to find these interfaces or add-ons (they were
once very expensive). greetings - Andreas

> http://www.fmlynet.org

Hello,
Boss-XL and BOSS-XE might look cool, but these GUI`s are completely
written in Turbo-Basic. Easy for extending and coding some further
add-ons, but not usable as an A8 internet browser. Rather something to
play with... Besides, they are programmed in Germany, yes. I know the
programmer Mirko Sobe very well. Greetings - Andreas

[Boss XL and Boss XE]
Where can you find this shareware program? BOSS-XL-XE Please
send a
> link..
>
> Thanks

Hello,
both programs are coded by Mirko Sobe in Germany. The BOSS-XE appeared
as "ABBUC Jahresgabe 1999", the BOSS-XL is an older tool once sold at a
german Atari fair. Since Mirko does not have internet access they are
not (yet) avaiable anywhere,only directly from him (via snail-mail,
since he does not have e-mail). I could provide BOSS-XE, but since Mirko
is selling this program, I do not believe it is PD or Shareware...
greetings - Andreas

4252. Atari 800 Items - Free for the taking

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-11 00:00:00 UTC
From: C Schell <schell@san.rr.com>
Message-ID: <396B8A23.F5E55401@san.rr.com>
Source record: 43519

Hello,

I have a large lot of Atari 800 items that I'll give away to anyone who is willing to pay the shipping charges. I'm moving and I'd rather ship them out now than move them with me or send them to the landfill. Keep in mind that these will probably take up two large, heavy boxes so shipping will be high, possibly around $40.00. (I will only ask actual shipping, no handling.) I'd rather not part this out.

You can see a list of the items at the following URL. The list is fairly accurate, but not perfect.

http://www.schells.com/800stuff.html

I'd prefer payments via paypal, as I'm trying to do this quickly to get them out of my way for packing etc., but other methods will work if no one is willing to use paypal.

Obviously all of this stuff is given away as-is. Most of it worked when I tested it some months back.

Response via email is preferred, and email address is valid.

Thanks,
Chad

4256. 1027 Printer Question

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-12 00:00:00 UTC
From: llpwhite@cs.com
Message-ID: <20000712053019.17517.00000236@ng-bh1.news.cs.com>
Source record: 43523

I normally print through APE95/98 to a laser, which works quite well, but those Atascii characters still cause some problems. What can a 1027 do (aside from print very slowly)? Is it text only? Does it have any redeeming qualities other than LQ printing and being direct connect and compact and really cheap?
Thanks,
Larry

>need all of those at once, but how many of these can be chained
>reliably? Also, is there anywhere to get an SIO socket, I'd hate to cut
>up a cable if I didn't have to.

Seven SIO devices shouldn't be a problem. But if you want to be really sure, either get an APE interface (not the PC stuff, but an interface that has 1 input and 3 outputs, sold by Best. I'm not sure if he has them ready to use. But in kit form you can choose whether you want cables or sockets), te quintopuss (6 sockets. The deluxe version has switches to switch two of them off. Sold by CSS. IIRC there is a picture of the quintopuss at www.nleaudio.com/css somewhere.) or as Bob Puff (which can be seen and contacted via that same site) if he still has those SIO BOOSTER cables. They once where 39.95 per cable IIRC. Yep, that's US Dollars, not zlotty or rooble (sp?) or italian Lira.

Best Electronics has a lot of stuff (can't remember the internet address. Something like www.best-electronics-ca.com). Even if you never wanna buy anything from them, get their catalog. It's the closest thing we'll ever get to an Atari Encyclopidia.

Message-ID: <rqXsMKAF4Hb5Ewzw@lovecraft.demon.co.uk>
Source record: 43527

Hi!

Just got two wonderful XLs, one blue with Gumby (still trying to find out if it is working correctly) and PIA, plus Freddy (according to the internals) but I wasn't told it had extended RAM, and one red with extended RAM and a neat little LED for bank selection information.

The blue one especially has seen a lot of changes, having two PIA connection holes, a mysterious DIN connection hole, and a row of LED holes and four mouse-switch type function keys. The red machine is essentially stock, and the top half looks good with the black and red LED display, but the lower case has had a PIA installed and removed, so has a hole in it.

These modified machines have been done pretty well, and the repainted cases look great, so I want to reshell them (repainted, of course) to get rid of the extra holes!

Having owned several, I can state that they have no redeeming qualities:
they're dog slow, noisy, and prone to going out of alignment so that your
printed lines are waves.

Beyond 12 cpi text, the only other thing that can be done is printing
of the international character set.

Probably the cheapest way to print ATASCII characters is to use an old
dot-matrix and something like the G: device--the 1027 will definitely
never give you graphics (at least those you intend).

The best use I ever made of one was after it died: the right side of
the PCB can be hacked off and used as a really good 5VDC power supply.

John,
Don't know the answer to your question abot using your cable as a SIO2PC adaptor (I would have to guess not, but that the SIO2PC cable is fairly inexpensive considering what it can do for your Atari8 computer). Just wanted to welcome you back. I started back into the Atari scene in 1998 with my original Atari 400 w/ 48k and 1400xl keyboard. The 850 interface was toast and the original percom drives fried from years of use.

Oh wah! I can't believe you gripe about Atari being gone even
when Hasbro is doing a bang up job releasing games with the Atari logo. Hasbro
has practically renamed the video game division after Atari, and sported the
Atari logo on Television, making it a household name all over again.

Andreas,

What you'll most likely need is a small "front-end" device to handle the
TCP/IP side of things, one guy put an Atari 800 on the web as a webserver
using an old terminal server. In the latest issue of Popular Electronics,
there is an article of putting your appliances onto the web as HTML devices,
well if a device such as this could be hooked to the SIO port or PBI/ECI port
on the Atari and allowed the Atari to communicate through it onto an ethernet
LAN or a dial up device, then yes, an Atari 8bit could get on the net and read
newsgroups, email and access sites with Text content. Its the TCP/IP stack
that is holding the 8bit community back, also look into Zilog, they've got a
new iZ80 processor which is webbased, again with a small front end device to
program the IP address and handle all of the communications and bring it down
to a serial connection into the 8bits we've got it made!

I searched, but I don't think I found them.
I found 'Nightmares' by Duncan Stuart. You are a flyer with wings
and shoot space ships, while monsters walk on the ground.
I found 'Domain of the Undead', a British title, you shoot skeletons
in a graveyard.
Neither is by Epyx.
I'm not a big gamer. It would be good if you or somebody who remembers
the games could describe them. Might help in finding them.

14-7-2000 we will release a new romdoctor. Romdoctor is a renamingtool
based on the goodtools and the TOSEC Renaming standard.
It will be downloadable from www.emuware.com and
http://syntaxerror.rebelz.org

romdoctor will have an internet update feature so u will never have to
download renaming databases again. all u will have to download is the
v0.1 database for a specific system
Romdoctor 1.0 will recognise 40 different systems when we release it
and this number will keep on growing
Romdoctor will b able to make miss and have lists just like the
goodtools from cowering.there will also be an "unrecognised files"
option to scan for unknown stuff...

Could probably do that also...
Most emulators allow you to select a file or subdirectory from the HD as one of your drives (D4: or D5:..); from there you can manipulate it with a copy to an .ATR or .XFD or a binary load directly to the emulated 8-bit. May have to use Yogi's loader or rename it to AutoRun.Sys on a boot .ATR or .XFD as a lot of game .EXE's overwrite the DOS.SYS which is attempting to load them.

Someone sent me a TruType ATASCII font which works great from windoze with my ink jet or my 24 pin, BUT the inverse and control graphics are out of order to generate the intended output! Anyone have a correctly ordered font or the ability to rearrange this one?

I have tinkered with XFormer on the 24 pin which does nice bit graphics but does not accept the G: Epson control codes. Am currently working on a lister program to read and rotate the font matrix and convert it to a 24 pin bit image...

> when I try to connect them that way ?

The composite video on your XL/XE computer is exactly what
those Audio/Video IN jacks on your electronic equipment need.

Keep in mind the female RCA jack on the back of XL/XE computers is
NOT composite video, it is RF. To get composite video and audio, use the
5-pin DIN jack.

But you probably already knew that. =)

Exactly. Sure, it's nice that Hasbro Interactive is now called Atari
Interactive but that's just a name. Nothing else in common.

Howdy folks

The source to the JPEG viewer (both black and white and color version) for the C64 are available on the net.

I have heard that it wouldn't be to hard for a programmer to translate C64 specific code into Atari specific code. Unfortunately, I don't speak assembler, neither C64 nor Atari 8 bit.

Who wants that job?

Only thing I can offer is that I will be available when the program is ready for testing once translated.

The Crypt of the Undead was a game where you were a character locked in a large cemetary, with a mausoleum and tombs and crypt of CC Demilles and other stuff. The Nightmare was a game where you were in a giant 3 story Haunted mansion. Both games required you to search for certain objects, in a specific order, in order to escape by the end of the night. I am positive they were by Epyx, for the 400/800. They required the Basic cartridge to run on my 800xl. If anyone has them in .atr format, feel free to email them to me!!
:)
Thanks a bunch,
Steve Breech

On Tue, 12 Jul 2000 02:01:46 , "Greg Goodwin"
<Greg.Goodwinp0.f2.n8.z8@fmlynet.org> drooled an embarassing wet spot
in his lap as he typed:

>FamilyNet HQ: Telnet:\\www.family-bbs.net
>
>Oh wah! I can't believe you gripe about Atari being gone even
>when Hasbro is doing a bang up job releasing games with the Atari logo. Hasbro
>has practically renamed the video game division after Atari, and sported the
>Atari logo on Television, making it a household name all over again.

Uh ... first of all, I wasn't griping. I was explaining. But since
we're on the subject, I wouldn't really call Hasbro's pimping the
Atari name around to sell games as a 'bang up job.' Sure, it's nice
to see the familiar Fuji flag still waving, but let's face it: it
doesn't stand for anywhere near what it used to anymore. They've
taken a few classic Atari licenses and revamped them to modern
versions which, in their own right are enjoyable enough, certainly,
but do you really think that /new/ games (which is to say, new
original games) released under the Atari moniker are going to carry
the same weight and respect they did under Atari emeritus? Not with
me, anyway, because beneath it all, it's still a Hasbro game.

And yes, I know Atari has changed hands several times in the past;
from Bushnell to Warner to Tramiel to his three buffoons, but at the
very least each time it changed hands then, Atari continued pretty
much as it always had: Always bringing new innovations and good ideas
to bear. Atari's resurrection this time is more like a sad attempt by
Hasbro to sell games under a name that once commanded great respect in
the hopes that they can sell more titles because of its history.

>
>Iain

That's what I'm trying to get at. Hasbro's acquisition and subsequent resurrection of the Atari name amounts to little more than Hasbro waving a familiar and welcome flag in an attempt to attract former Atari faithfuls into buying their games. The problem is, the majority of Atari faithfuls put stock in Atari for far more than their games. In was their hardware that attracted Atari users, their long and prodidgious history of innovation and creativity that brought insight and fresh thinking that the rest of the industry eventually tried to copy or better. Colour handheld portable game systems, palmtop PCs, the proliferation and popularity of MIDI gear, and patents innumerable all owe their origins to Atari. The Atari name under Hasbro's command has nothing at all to do with any of this. They're just pushing games...

Hello Everybody,

I was wondering what your favorite Atari 8-bit
video game happens to be?

I have specific ones in each of these categories
listed below---

Favorite Classic Sci-Fi Arcade Game:

"Deluxe Invaders" by Roklan Software
(This was the true "Space Invaders" for
the Atari 400/800, XL & XE computers)

Favorite Classic Arcade Maze Game:

"Pac-Man" by Atari [and later DataSoft]
(DataSoft's captured the intermissions
which Atari's cartridge had missed)

Favorite Classic Computer Game:

"Astro Chase" by First Star Software
(Fernando Herrarra wrote at tough
game to beat for the 8-bit computer)

Favorite Movie Game Adaptation:

"E.T. The Extra-Terrestrial"
(The seldom seen computer version
was better than 2600 version was)

Wally

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

Slick wrote:
"My little girl wants to build a robot, and the idea intrigued me. I am wondering what computer to use. I have an old Acer Aspire 75MHZ machine that WAS about to go in the trash. But I grew up with an Atari. I know nothing about the PC. I know a little Visual Basic and thats it. I know my way around the Atari a little better and feel like I would have a little better luck with it. The things I can see that the Acer would benifit me on is speed, RAM and harddrive compared to the Atari. Which do you all recommend? Also, if Atari, should I go with 2 joystick port or 4? I do like the idea of a 130XE with 4 megs of ram, but would giving that up for 4 ports be worth it? And what about the expansion slot? Any and all input wanted and appreciated."

The input comparison is as follows: 1 Atari joystick port supports (as I recall) 5 binary and 2 analog inputs, which are easily accessible from BASIC (STICK(n), STRIG(n), etc.). A 4-port model (such as the 800) will thus allow for 20 binary inputs and 8 (4 may be the limit on paddles?) analog inputs (is someone checking me on this?), while a 2-port model (800XL, for instance), will allow for 10 binary inputs and 4 analog inputs. 1 IBM PC joystick port supports (again, to the best of my recollection) 4 binary and 4 analog inputs, which are a little more complicated to access (but not that bad) (I'm not sure about the various IBM PC BASICs). Of course, the PC also offers parallel and serial ports, but I am not sure how easy they are to access. I couldn't comment much on output control lines, but the Atari has a built-in TV-compatible video system (if you care).

The big issue, of course, is processor speed. An Atari 8-bit runs an 8-bit microprocessor at less than 2MHz, while your Acer runs a much more sophsticated 32-bit processor at 75MHz. Running Windows will, of course, eat into that.

Howdy Lonny, folks

>On my GFA-Basic site you can find a Jpeg viewer coded in of course
>GFA-Basic.

Is that tokenised (like on the 8 bit Atari) or ASCII?

I guess we still need somebody who know assembler, since it takes some doing to
get the 8 bit Atari to display somethign with enough colour and/or resolution.

BTW The name of the site Jason quotes is correct.

Favorite Classic Sci-Fi Arcade Game:
Star Raiders and Dropzone (or do you mean arcade ports ?)

Favorite Classic Arcade Maze Game:
Pac-Man Datasoft

Favorite Classic Computer Game:
Rescue on Fractalus

Favorite Movie Game Adaptation:
Is it any to choose from at all, except ET ? Superman from First Star (I think) I think I'd choose Buck Rogers for the best of them

Other great games
Platformers like Miner 2049'er, Bounty Bob Strikes Back, Draconus, Valdgira's Axes (or something like that), Cavernia, Donkey Kong
Shooters like Moon Patrol, Robotron
well, also stuff like Ballblazer, Lode Runner, Starfleet I, Archon, MULE, Frogger, Shamus : Case II, Wizards Crown, Alternate Reality

come to think of it, many Atari games are really great compared to PSX and N64. I do love my DC and about 75% of the games are good or better. PSX I have a 2% playable games, Atari is about the same as DC I guess. Long live Atari (not the company, too late for that :-(the machines and it's devoted fans)

On the bright side, at least it is a corporate acknowledgement that the old
games that were design around game play vs purdy graphics still have value
and Hasbro recognizes it.

There was a lot of crap brought out at the same time, some with fairly
familiar names, that Hasbro could of gone after for peanuts but chose not
to.

Kind of like saying they value game play, which if I was still into games
would convince me to look at their stuff vs some of the other outfits.

Time will tell of course, but Hasbro is a monster in video games right now,
one of the top ten in the world. It won't be until their next round of games
before we find out if game play is a corporate commitment or just a fluke.

Star Raiders or anything from Lucas Games.

Alternate Reality, although it was never completed, still is a classic CRPG
for what it achieved. Current MMPOG like UO and EQ are still trying to get
things like Factions and Karma working right and 15 years after AR came out
it is still the standard.

I don't have them separated by genre but here are my favorite 8-bit games
(all of these I played on the Atari 800XL):

Kaboom
- It played a little tune when you caught the bombs.

Bruce Lee
- I would get a friend to play the green guy and keep the ninja off of me so
I could complete the game.

Karateka
- Before Street Fighter, before Mortal Kombat, there was Karateka.

Rescue on Fractalus
- To this very day I still I have nightmares about this game.

Pitfall 2
- It has a great tune that gets stuck in your head.

Honorable mention
One on One (Dr. J & Larry Bird)
- I didn't play this game a lot but my brothers did. I've never seen two
people play a game as much as they played this one.

I know there are a lot more I left out, I wish I had a list of my games
close by. All this talk makes me want to hook up the XL again and play.

Love their version of Wizard of Wor! So know where I could find a ATR
image of this?

> Favorite Classic Arcade Maze Game:

Really? I never knew that. The intermissions were cool, though I always
thought that Pac-Man was lame. Even back when it was popular.

> Favorite Classic Computer Game:

This game sounds familiar.

Hmmm... before I say anything here, I'll let you explain why you think the
Atari 400/800 version is better. I'm curious.

I can't believe I forgot Ballblazer and Archon in my list. Ballblazer was probably the first split screen game I ever played. When the Pokemon craze first started my brother and I hoped the game would be like Archon where you could actually control the action. But alas, Pokemon sucked.

I'm glad someone agrees with me that there are barely any playable games for the PSX. The DC does have some good games from what I've played (NFL2K, Soul Caliber, Crazy Taxi, Hydro Thunder). I agree that Atari has the most great games.

: Favorite Classic Sci-Fi Arcade Game:

Hmmmm. Tough call; I'm trying to recall what good adaptations there were. Roklan's Deluxe Invaders put Atari's version to shame. (Why their 2600 conversion was better than the 8-bit version is beyond me!) Also I liked Missile Command. In terms of original sci-fi game for the Atari computer, I like Final Legacy.

: Favorite Classic Arcade Maze Game:

I also choose Pac-Man. I played that a lot. Special kudos to John Harris' Jawbreaker, a nice little clone with some neat twists.

: Favorite Classic Computer Game:

I guess for nostalgic reasons, and that it was also one of the first games I got with my Atari 800, I would choose Star Raiders. Even today, the game is simplistic, but it did have quite a bit of entertainment value to it. Even to this day, I have never fully mastered the commander level. Those dang Zylons always do damage to my ship before I have the chance to do anything. :)

: Favorite Movie Game Adaptation:

I would probably have to go with E.T. as well, even though that game didn't have enough depth to it. What other titles were there? The only other one I can think of is The Last Starfighter, although it doesn't really count since it was re-fitted to become Star Raiders II. WarGames wasn't too bad, either--but it was hard to play.

> system (if you care).

You can configure the joystick input pins as binary outputs (4 per
joystick jack)- they won't source very much current, but are suitable
to drive transistors/other circuitry. The "analog" inputs (IIRC) are
not ADC channels- the circuitry measures the time it takes for the
current thru the paddle pot to charge a known value capacitor- the
output of the pots is the # of tv scan lines it took to charge the
cap. Its suitable for a feedback loop where you can put a varying
resistance into the pot inputs. They would work fairly well as
digital inputs.

Interfacing to hardware is somewhat more problematic with PC's. In
DOS, you end up doing peek/poke or I/O primitive stuff- unless you use
something like Visual Basic (or whatever) with the appropriate
drivers.

If you want to use serial, you're nearly always stuck with a
standalone microcontroller, which gets you into some heavy code
slogging. I have seen a couple boxes with digital IO and ADC channels
directly addressed via serial port, but its been about 10 years...

Atari Basic is plenty fast for lightweight work, not for realtime, but
for playing about with little robots its quite suitable- and heck of a
lot better implemented than something like a Basic Stamp. Its also an
easy environment to work with- no slogging thru Windows bugs and
coaxing drivers to life. If you use APE, you can keep the Atari
source on your PC and not worry with floppies.

I think a lot of what Will has to say goes along what I would say. The
joystick ports being binary and analog has been very helpful in all sorts of
projects like this. My dad is working on making a computer that will read his
car's computer, but the car's computer talks binary. To get a modern handheld
computer to talk to it will require a special converter that he is trying to
make with basic stamp, blah blah blah to talk to the serial port. Where-as the
Atari8 could simply take it in through the joystick port.
All and all the Atari8 is very adaptable in the end, and is a marvel in the
8-bit world I think. You have the joystick ports, you have the cartridge ports
that could store the program once you make it. (write program, send it to
E-prom, make cartridge... can be a bit complex, but I always liked things in
cartridge form.) And for what it does, the memory is quite good.

Anyone have any info on Atari's talking to onboard computers for cars?
This has got me wondering. :)

(Sticking to the categories given...)

Favorite Classic Sci-Fi Arcade Game:
Asteriods, Joust

Favorite Classic Arcade Maze Game:
Wizard of Wor

Favorite Classic Computer Game:
Star Raiders, Archon

Favorite Movie Game Adaptation:
The Last Starfighter

I think also that "Return of Heracles" deserves mention somewhere.
Played that last night, and it is a truly awesome game.

Nope, working title. Epyx or Activision, I think, released it under the name Rescue on Fractalus

> To this day this is one of my favourite videogames. I used to play late at
> night with the lights out and when
> the alien pilot jumps up at the window ... AAAAARRRRRGGGGGHHHHH !!!

Cool. We had the same experience. It's awesome. Lucasfilm (or Lucasarts or whatever) should release this on Sega Dreamcast. That would rock

> Hmm, where did I put my XL ??? ;-) (Oh yeah, it's right here. Time to rescue
> some pilots from the Jaggi on Fractalus !)

I start to feel the urge myself. However, kids and wife takes a bit of time too, so. I'll be playing Resident Evil : Code Veronica tomorrow. Anybody played this ? It has some shockers too. Really good

I got the 4.53 from XLSearch, but all of the internal comments and the Read.Me
file both say it is 4.50 from '88. Have not seen it anywhere else...

-Ron

I don't have a solution but I admire the problem.

I update my catalogs once a week. Just before this message is posted. So when you see a new posting, check my Catalogs. After I post this message. I'm off for the weekend. But I'll be back after the weekend.

Check out my Atari Catalogs. Find Hardware & Software, +NEW in BOX/BAG! Dealing in Atari Lines for Classic Atari 8 Bit, Atari ST and the 64 Bit Atari Jaguar Game Machines. Especially my ST line of Software, lots of Games +NEW in BOX As well as Jaguar, +NEW in BOX! To find these, search my Catalogs looking for the text "+NEW in BOX" to find these items!

Discounts apply to both Used and +NEW in BOX/BAG Atari items! Including Classic Atari 8 Bit, Atari ST and Atari Jaguar lines of Atari Computers & 64 Bit Jaguar Game Machines. And I sell and ship to most any Country!

Looking for Free Atari catalogs? Skip to the bottom, otherwise read on!

To take advantage of Atari Discounts or FREE Atari Items, Please Read on. These offers are like Coupons, designed to attract business, still, if a customer does not redeem/present the coupon, I am not obligated to honor it. To redeem the coupon/offer, you must E-Mail me to Claim it by repeating the offer and state what you want to buy! Please be specific!

e-mail: atari@benjamin.net

To take advantage of Discounts, FREE Monitors or FREE Jaguar Cable, you must E-Mail me to Claim it and state what you want in E-Mail. Read on!

Discounts! Buy now! 5% Discount with a $50 Purchase. 10% Discount with a $100 Purchase. 15% Discount with a $150 Purchase. And a 20% Discount with a $200 Purchase. Discounts Apply to Classic Atari 8 Bit, Atari ST and/or Atari Jaguar. Hardware, Software, Books & Accessories! Both Used and +NEW in BOX/BAG! And I ship to most anywhere in the World!

FREE Monitor with Atari Purchase! Buy either an Atari 1040STF, Mega ST2 or 1040STe & receive a FREE ST Monitor. Your Choice of a Color or Mono-Chrome Monitor. FREE Monitor when purchasing an Atari 8 Bit Computer. Buy an Atari 800XL or a 130XE and receive your choice of any Monitor in the Atari 8 Bit Hardware Catalog. And FREE when purchasing $50 worth of Atari Jaguar items, receive absolutely FREE, a +NEW in the BAG Jaguar Stereo Audio/Composite Video Cable.

Offer Available for Limited Time only. First Come, First Serve! Subject due to availability! Customer pays Shipping! Substitutions considered.

I've added more and will be adding more Hardware, Software, Books and Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out into Atari Jaguar Hardware & Games. So checkout what's new on my Web Site. In Fact, check it regularly as my Catalogs are updated regularly. Customer's are served, first come, first serve! No competing in auctions. Just Sales, Support & Service! I have 8 different Catalogs, & my SoftWare Catalogs are my largest. They have the biggest Byte Count. You should see my inventory! I have TruckLoads of HardWare, Boxes and Boxes of Software & Libraries of Books & Reference Material for the Classic Atari 8 Bit, Atari ST & the Atari 64 Bit Jaguar Game Machine! And remember, if you can't come see me today, come see me tomorrow!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari 64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump to my FTP site linked to my WebSite so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor & view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend.

Oh man I forgot Mercenary. I completed it 3 different ways and mapped the
whole game. It took ages but it was brilliant.
(Yeah the Graphics 15 Version was better !)

> Player vs Player: Spy vs Spy 2 the island caper (Great music too)

Hmm, haven't played that in a while.

> One game I never completed that I would like to revisit: Spell Bound

Nope, I didn't complete it either !

> I also enjoyed playing Star Quake (Cheops Pyramid anyone ?)

Had it, never got on with it !

Paul

When addressing a disk drive from DOS or BASIC on the Atari, they are
generally addressed
as 'Dx:' where the x is the drive ID number. In BASIC, these references
must always be in quotes. eg. "D1:BASIC.BAS".

> Read from drive?

From BASIC, assuming a disk contains a BASIC program called 'TYPING.BAS'.

LOAD "D1:TYPING.BAS" [ENTER]
RUN [ENTER]

> Write to drive?

SAVE "D1:FILENAME.EXT" [ENTER]

> List files without using the DOS?

This requires you use the OPEN and INPUT commands to read the information
from DOS.

```
10 TRAP 100
20 OPEN #1,6,0,"D1:*.*"
30 FOR FILE=1 TO 128
40 INPUT #1,DIRSTR$:? DIRSTR$
50 NEXT FILE
100 CLOSE #1
```

> Can I use 5 1/4 double sided double density disks in the drives? I can
not
> remember the difference in the single or double density.

Yes those will work fine as long as they are sold blank.

Steve

4321. Clearing Remaing Atari 5200 items

Last Updated 07/15/2000
- Sold/Traded Items Removed

I have the remaining Atari 5200 items for sale or trade. I have decided to clear off all my spare Atari 5200 items, including some from my personal collection. All units are fully functional, cleaned and detailed, and in good or better condition. If you have any questions in regards to unit, box, or label condition, please feel free to ask. Shrink-wrapped cartridge orders of $60 or more receive free shipping within continental North America.

All prices quoted are in U.S. funds with the buyer paying shipping. For items that I am taking offers on (no price listed), please make all offers in U.S. funds., some prices may be negotiable. I am also willing to trade for certain items, please see my list at the end of this post.

If you are interested in any of these items, please use this link to contact me jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.5200 (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari/TI 99/4A), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

This list covers the following Atari categories:
- Controllers
- Shrink-wrapped/New Games
- Multicarts
- Atari Force Comics

Controllers for Atari 5200 & Computer Units
==========
These controllers are intended to use the standard Atari plugs, and require an adapter to work on the 5200.
- 2x Suncom Tac Joysticks $10 for the pair
- 1x Spectravideo Joystick with suction cup base

** Atari 5200 Titles - New/Shrink-wrapped**
==========
Shrink-wrapped cartridge orders of $60 or more receive free shipping within continental North America.
- Ballblazer by Atari/Lucasfilm $20
- Pitfall by Activision $15

- Rescue on Fractalus by Atari/Lucasfilm $25
- River Raid by Activision $10
- Space Shuttle by Activision $12
- Zone Ranger by Activision $10

Multicart Cartridges
==========
- Atari 5200 Multicart $125 - Contains all of the released 5200 game titles as well as demos and the 5200 diagnostic cart. Game selection is done by using DIP switches.

Atari Force Comics Please make an offer
==========
All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for/towards rare or sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- A working 6000 series Dish Network receiver
- A valid Dish Network card
- Valid DSS H or HU Cards
- And of course the ever popular, original Intellivision keyboard
- Atari Force Comics Issue #1 (January 1984), Issues 4 thru 7, and Issues 12 thru 20

4322. Re: Needing help with Atari 1050 disk drives

"CJ" <cjlink@mindspring.com> writes in article
news:8kq3k6tad1@slb0.atl.mindspring.net...
> I am using Atari DOS version 2.5.
> What Atari or Atari Basic command should I use to do the following action:
>
> Target a specific drive ? for example A:\ B:\
Atari disk drives are numbered 1...N, eg. D1: D2: etc. If you don't supply
a number (eg. D:) drive number 1 is used.

> Read from drive?
Depends on what you want to read:

1. Reading a byte at a time:
```
1 OPEN #1,4,0,"D1:MYPROG.LST"
2 TRAP 4
3 GET #1,B:PRINT CHR$(27);CHR$(B);:GOTO 3
4 CLOSE #1
```

This actually lists a textfile from disk, thus answering your next question.

2. Numbers (your bank balance, or whatever):
```
OPEN #1,4,0,"D:BALANCE.DAT"
INPUT #1,DEBT
CLOSE #1
```

Strings work the same way, just use MY$ instead.

> Write to drive?
Analogous to reading.

Here's a little table:

```
Write Read Read/Write
-----------------------------------------------------------------------------
OPEN OPEN #1,8,0,"D:..." OPEN #1,4,0,"D:..." OPEN #1,12,0,"D:..."

byte PUT #1,B GET #1,B
number PRINT #1,N INPUT #1,N
string PRINT #1,A$ INPUT #1,A$
```

Don't forget to close files after you're done, or you'll get some errors on
reading or loose what you've written.

> Save basic programs to the drive?
```
SAVE "D1:MYPROG.BAS"
```

Use LOAD "D1:MYPROG.BAS" to load a saved program.

You can also list a program to disk (saving it as human-readable text instead of tokenized BASIC) by typing LIST "D1:MYPROG.LST". If you just want to list part of a program, you can append line numbers (LIST "D1:MYPROG.LST",1000,2000).

Reload a listed program with ENTER "D1:MYPROG.LST". Note that ENTER (unlike LOAD) does not clear any already loaded program from memory, this can be used to merge different pieces of a program together.

Note that it is advisable (due to an error in BASIC, which can lock-up the computer) when developing larger BASIC programs, to occasionally list the entire program to disk, typing NEW, and then re-ENTERing it. This also removes unused variables from memory.

> List files without using the DOS?
See above.

> AND any other useful disk drive commands would be appreciated.

You can do a lot of things you normally do only from DOS (formatting, deleting, etc.) by using XIO commands, though I don't know the numbers off the top of my head (and I don't have my BASIC docs handy at the moment).

> Can I use 5 1/4 double sided double density disks in the drives? I can not
> remember the difference in the single or double density.
Yes, no problem!

Using other devices is analogous:

making a printout: just use "P:" as device

saving to casette: "C:"
remember to use fast mode when reading/writing to from casette (or you'll have to wait for ages): OPEN #1,4,128,"C:"

reading a single keypress:
OPEN #1,4,0,"K:":GET #1,K:CLOSE #1

The documentation on appending files is in the DOS2.5/1050 manual.
COPY
D1:file1,file2/A
will append file1 to the rear of file2 as odd as that sounds. I would
try to make the R: handler file2 so that it actually loads in first.
Best of luck.

Yes, absolutely correct for XL and 1050..

>2) Is the DIN cable compatiple with the Commodore monitor and the 800XL?

Yes it works great.

>3) Can I download a boot image and put it on a floppy, or must I get
>an already-made boot disk?

You will probably need a bootable disk; the hardware considerations for
transferring a disk image to Atari 8-bit 5.25 format are somewhat arcane. It is
possible with SIO2PC or APE and supposedly something called Anadisk.exe (which
has never worked for me).

-Ron

I don't have a solution but I admire the problem.

The answer for DOS 2.5 or SmartDOS is already given.
COPY D:FILE1.EXE,FILE2.EXT will put FILE1 at end of FILE2.
You do need the correct handler. It looks like you're using an
Rverter interface, which I'm not familiar with.
Some R: handlers must be loaded at boot time. Most, and I'm not
familiar with the Rverter handler, can be loaded any time, ie. you don't
have to append the diskformer to the handler, just load the handler,
then load the diskformer program.
If you're using an 850, you'll need a different handler.

Don't give up the search - someone's got to have them.

I first heard about those 2 games from ads I read in a 1983 Creative
Computing magazine. The ads looked so cool, and yet had no
screenshots of the actual games. The descriptions and artwork intrigued
me. Being a C64 guy, I was disappointed that it was only made for the
Atari. Strange, but last night I found that old mag and was flipping
through it when I came across those same ads. I always wanted to see
some screenshots and actually play those games.

Anyway, I've got 2 high-quality scans of those original magazine ads, if
you're interested. They might give you some more info on the games.
E-mail me and I'll send them to you. And if you do get a copy of the
games, maybe you could recommend me a good Atari emulator and I'll
finally see what I've been missing.

BTW, check out this link to see what the author is currently doing
http://www.businessweek.com/ebiz/0002/em0216.htm
Pretty amazing what and who you can find on the net.
Good luck, and let me know if you'd like those scans.

Pete

This is hard but...

Classic: Star Raiders
Sci Fi: Mercenary (XL version Graphics 15 not 7 :)
Player vs Player: Spy vs Spy 2 the island caper (Great music too)
Flight sim: I used to battle my friends in Mig Alley Ace

One game I never completed that I would like to revisit: Spell Bound
I also enjoyed playing Star Quake (Cheops Pyramid anyone ?)

Cheers
Peter

4339. Need Help w/ Diskformer! How do I "append" Files?

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-15 00:00:00 UTC
From: NOSvelcro@netunlimited.netPAM
Message-ID: <39706a45.2408631@news.netunlimited.net>
Source record: 43491

I have my Atari 800 set up with a null-modem. I can transfer files by way of BobTerm. What I want to do however is use the x-modem function of Kenneth Sider's Diskformer to write directly from the serial connection to floppy disk. Diskformer has all the options to do this, but I get an RS232 error immediately when I try. I believe it is because the R-Handler is not running. But how do I install the R-Handler?

Here is what the Diskformer docs say:

"Copy the R: handler to a filename of your choice (DISKFORM.COM
for example) and append DISKFORM.EXE to it.
Loading: Load the file (DISKFORM.COM) and the
R: handler should load followed by DISKFORMER. BOBVERTER with a
home built type R-Verter type interface was used in the
development of this program."

The BobTerm disk has an rverter.com file I could try. But I do not know the first thing about "appending" two executables. There is not "append" option in DOS 2.5 or SMartDOS that I can see.

Please help!

4340. Atari 800XL question

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-15 00:00:00 UTC
From: Eric Chomko <chomko@IDT.NET>
Message-ID: <8kpvhf$7vu@nnrp2.farm.idt.net>
Source record: 43492
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari

I recently purchased an Atari 800XL and am trying to hook it up. I have
the following items:

800XL unit
Model: C061982 power supply

1050 disk drive
Model: C017945 power supply

1010 tape unit w/1010 PS

Commodore 1084s monitor
DIN-5 to RCA male black,white,yellow,red

It all seems to be what is need short of a boot disk.

All fits perfectly, but before I put power to the system, I'd like to
know the following:

1) Are the power supplies mentioned above correct for each unit?
2) Is the DIN cable compatiple with the Commodore monitor and the 800XL?
3) Can I download a boot image and put it on a floppy, or must I get
an already-made boot disk?

Thanks in advance for any help,

Eric

4341. Needing help with Atari 1050 disk drives

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-15 00:00:00 UTC
From: CJ <cjlink@mindspring.com>
Message-ID: <8kq3k6tad1@slb0.atl.mindspring.net>
Source record: 43493

I am using Atari DOS version 2.5.
What Atari or Atari Basic command should I use to do the following action:

Target a specific drive ? for example A:\ B:\
Read from drive?
Write to drive?
Save basic programs to the drive?
List files without using the DOS?
AND any other useful disk drive commands would be appreciated.

Can I use 5 1/4 double sided double density disks in the drives? I can not remember the difference in the single or double density.

I am interested in creating some programs for my Atari system, and I am all for the open source code movement. If you would be interested in obtaining a copy of my programs just let me know. I have been thinking about creating a web site just for posting Atari Basic program listings so that other people may gain interest in creating new programs for the 8-bit Atari PCs.

Thank you for your help,

John

You are in an empty room with Eric Chomko <chomko@IDT.NET>. There's a
rock in the middle with "Y2" written on. A hollow voice says:

>1) Are the power supplies mentioned above correct for each unit?

For the XL series AFAIK if the plug fits the PSU is correct. I could
check a real PSU upstairs but I'd have to empty half a cupboard to
reach it!

>2) Is the DIN cable compatiple with the Commodore monitor and the 800XL?

Can't answer that one unfortunately.

>3) Can I download a boot image and put it on a floppy, or must I get
>an already-made boot disk?

You don't need a boot disk - the 800XL has BASIC in ROM so it should
give you a nice blue screen with a 'ready' prompt.

cheers

4343. Brand New Atari Jaguar Items for Sale/Trade

- Last Updated 07/15/00
- Sold items removed

I have a limited amount of brand new Atari Jaguar items for sale or trade (these are not refurbished units). These packages are ideal for new collector's or somebody wanting to start or add to their Atari collection. If you have any questions, please feel free to ask. I am also willing to trade for certain items, please see my list at the end of this post. All prices quoted are in U.S. funds with the buyer paying shipping.

If you are interested in any of these items, please respond to me by using this automated link jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.Jaguar (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

** Atari Jaguar Packages - Brand New (with controller, RF Box & AC adapter)**
==========
-.Atari Jaguar with CyberMorph cartridge and Composite Video Cable $45
- Atari Jaguar with CyberMorph cartridge $35
- Atari Jaguar (No Cart) $25 - Only a couple left

** Atari Jaguar Accessories - New**
==========
- Jaguar unit alone (No power supply, controller or accessories) $20
- Team Tap (4 Player adapter) $25
- Composite Video Cable $15
- Spare Controller $15
- AC Power Supply $10
- RF Switch Box $5

** Atari Jaguar Games - New/Shrink-wrapped**
==========
- Checkered Flag $10
- CyberMorph $5 (No Box)

Atari Force Comics Please make an offer
==========

All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for/towards rare or sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- A working 6000 series Dish Network receiver
- Working DSS H or HU Cards
- And of course the ever popular, original Intellivision keyboard
- Atari Force Comics Issue #1 (January 1984), Issues 4 thru 7, and Issues 12 thru 20

drteele wrote:

I have a ICD MIO for my 130XE and the edge contact pads on the
adapter
board are so scratched up I have a hard time making a good
contact. Will
this 'defroster paint' help to restore my contact pads also?

For contact problems, the first thing is proper size feet to
support the card.
Next, take a sheet of typing paper and fold it to make a stack
about 1/16 inch thick with one edge only folds. Touch it to
contact cleaner or iso alcolhol and gently slid it into/out of
the contact socket to clean the fingers, but don't slide across.
Lastly, you may need to apply a thin smooth layer of solder to
the circuit board fingers. I use silver solder. This takes good
soldering skill.

>sound in an A8 sound form. And so on...

What does a GUI have to do with loading up device handlers/shared
libraries/data translation filters?
For that matter,what *IS* a "graphical" user interface.I'm using Linux's fbcon
(fbcon=frame buffer console;the names just keep getting weirder...)
so I'm always in graphics mode on my IBM PC/AT clone,just like the Linux
Amiga,ST and SPARC users are.And Linux has a (rather simple) line editor built
into it just like the Atari,Apple and Commodore OS's do.(though it's not as
good)
So it Linux a GUI?

"Click on a button"???

The Atari OS doesn't "hold" files open while they're executing like Linux does.
(though a file might load partially,do some initialization,load up some more,
and so on,but the user would never interact with the programme while this is
happening.This mostly happens when you've appended one programme onto the end
of another,like with terminal emulators and RS232 handlers)

In fact,the Atari OS has nothing in it for loading up programmes.That's entirely a user-level job.And the file only stays open while the (whole) programme loads up and then closes.Of course some games might be in two parts,with a tiny first part that just shows a title screen and then returns control to the loading programme (usually DUP.SYS) which then loads the actual game.

>In short: The browser would need an extended Atari (eqipped with
>Ramdisk) and would load all nescessary extensions/plug-ins from extended
>RAM/Ramdisk, whenever it needs them. But finally, I am not sure if this
>concept (just an example!) could be realised on an A8 (i.e. you would

>browser, the appropriate converter program and lastly the actual
>text/sound/graphic). Maybe someone finds an easier way and someday we
>really have an internet browser for the A8 avaiable, who knows ?!?
>greetings - Andreas

For the most part the graphics are not very useful so I'd be happy with a text-mode HTTP viewer.But files are just too big these days so it's better to just telnet to your friendly neighbourhood VMS or Unix system.
So just use Lynx! (or w3m or Emacs/W3...)

Of course a better version of Ice-T and FT-80 would be nice.
(especially flow control!)

4352. Atari Swap & Sale, Columbus, OH USA Sept 9.

Newsgroup: comp.sys.atari.8bit

Atari (and other stuff) Swap and Sale.
Regular Vendors appreciated! However, we've also had good "general
community" turnout in the many previous years.
RSVP not necessary, but appreciated if you're going to sell.
Please see details at http://www.icwhen.com/index1.html
or e-mail me.

Why would you need to "hold" a file open???
It is no problem to have a small program which loads other programs into
memory and executes them. Just load the file with a short self-written
routine, if you want it "compatible" look in every DOS-documentation and use
the Subroutine of the DOS you dedected or the best way just use the
XIO-Funtion of the DOS. I think there is one to load/execute binary-files!

4354. Jaguar Mousepads...

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-16 00:00:00 UTC
From: AtariVision@mail.com
Message-ID: <8kt53a$d5k$1@nnrp1.deja.com>
Source record: 43421

So far I have only 16 signed up on the list interested in purchasing a Jaguar mousepad.

If you are interested in one, and have not already e-mailed me stating you would like to purchase one, then please do so now :

ClintT@AtariVision.com

The price is going to be between $6-8 (that includes shipping to anywhere in the U.S. and a few extra goods possibly! :)

The numbers have to be bigger then 16 to get these moving, thats why I'm posting this now. The more of you that e-mail me wanting one,the faster the mousepads will be made and start rolling out.

Thanks,

Clint Thompson

Does anyone in the group know of any person or business selling the
following NTSC Atari 8-bit cartridges at a reasonible price?

Airball
Into the Eagle's Nest
Thunderfox
Gato
Karateka
Crime Busters
Diamond GOS
Crystal Castles

Thanks!

Mark

4356. Re: Need Help w/ Diskformer! How do I "append" Files?

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-16 00:00:00 UTC
From: NOSvelcro@netunlimited.netPAM
Message-ID: <3972331a.5900626@news.netunlimited.net>
Source record: 43423

Thank you all for the assistance with appending files. The copy-append feature works as advertised. However the R-handler still is not working.

There is still a local BBS in my area. I can dial out with Telelink to it so I know my hardware setup is okay. (Telelink won't actually display anything comprehensible but it does connect).

However I tried to dial out with BobTerm and it won't even drive the modem. So that is an R-Handler issue, right?

Now I have some differnet files relating to all this, but I don't really understand how they should be used.

AMODEM42.835
RVERTER.COM
ATARIRS.832

There is an AUTORUN.SYS file that appears to set up the AMODEM42.835 handler on the disk it came on. It seems to work (I am not using an 835) and it tells me the 850 is good to go. But when I load TCPTEST.COM or BobTerm it just doesn't want to make the modem dial.

This is all a big pain in the keister so I hope someone will advise me exactly how to configure what files to make my 850 dial out on my standard external modem.

Date: 2000-07-16 00:00:00 UTC
From: Rick Cortese <ricortes@netmagic.net>
Message-ID: <sn4u2decnd675@corp.supernews.com>
Source record: 43424

Try this:

```
20 CLOSE #1:OPEN #1, 8,0,"D:AUTORUN.SYS"
30 FOR I=1 TO 88
40 READ D
50 PUT #1,D
60 NEXT I
70 CLOSE #1
80 END
100 DATA 255,255,0,56,75,56,169,80
110 DATA 141,0,3,169,1,141,1,3,169
120 DATA 63,141,2,3,169,64,141,3,3
130 DATA 169,5,141,6,3,141,5,3,169
140 DATA 0,141,4,3,141,9,3,141,10
150 DATA 3,141,11,3,169,12,141,8,3
160 DATA 32,89,228,16,1,96,162,11
170 DATA 189,0,5,157,0,3,202,16,247
180 DATA 32,89,228,48,6,32,6,5,108
190 DATA 12,0,96
200 DATA 226,2,227,2,0,56
```

and hope neither of us made a typo.

Boot the disk with this on it and then insert a terminal program, preferably something like Bob term or AMODEM in some flavor for the 850, but w/o the handler built in.

If worse comes to worse, there are type in miniterm programs available that are just as short, but you will have trouble running faster then about 300 baud.

When you boot the disk, the autorun program should pause a bit and you should hear a tone as the 850 wakes up.

4358. Re: Need Help w/ Diskformer! How do I "append" Files?

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-16 00:00:00 UTC
From: Russg <russg@en.com>
Message-ID: <39727802$0$1497$53a6afc1@news.erinet.com>
Source record: 43425

UH. I'm trying.
It seems that BobTerm has a 850 R: handler in it. The files you
mention won't help you (AMODEM42.835, RVERTER.COM ATARIRS.832. they are a
term program for the 835, a r: handler
for the rverter and a RS232 handler for the 835.
I don't remember ever having to load a R: handler with BobTerm
however, it has a 850/PR: handler built in I think, unless you've got
a BobTerm with no R: handler. I'm going in circles.
Today's modems may not work so well with BobTerm, without some
fancy AT commands.
I just checked BobTerm documentation. It automatically loads the
R: handler from the 850 (BobTerm 1.2 or 1.21, I think).
If you load BobTerm and it doesn't tell you the R: handler is missing
or messed up, The R: handler is there.
So, that leaves the possiblitly you have a modern 56k modem perhaps.
If you can load BobTerm, and you have a null modem, and a term
program on the PC, like Procomm (4.3?), the old shareware one,
you should be able to type back and forth to the term mode screens.
Set the duplex to half on both and the baud to 4800, no higher than 9600.
To use the diskformer program, you will need to get a R: handler for
the 850. I'm sure you can find one. It should be something like
R850.HND file that you can binary load. I have several if you want
me to send you one.

I have the 7800 version of this game, and I think it's horrible. The music is, hands down, the worst in a video game, ever. Silence would have been better.

The controls aren't very easy to learn, and they're not very accourate. Is the 8bit version any better or fun to play than the 7800 console port?

4360. Lode Runner/Gato questions

Newsgroup: comp.sys.atari.8bit

From: Sneedy <mketler@goodland.ixks.com>
Message-ID: <39728E82.780103E8@goodland.ixks.com>
Source record: 43427

I have the Lode Runner and Gato carts for the XEGS, and since they did not come with instructions, I have a couple of questions that I'm hoping someone here can answer...

In Lode Runner, is there any possible way to restart a level? It's somewhat annoying to be playing and end up getting the character stuck in a nook where I can't get him out, and then have to reset the system and start on level 001. All that time and hard work are lost.

What's the objective of Gato? I understand you're a submarine, but without any instructions I have no idea how to play. I just move around a little bit, and toggle between the main screen and a radar screen, but there aren't any enemies and even if there were, I wouldn't know how to engage them in combat.

Thanks again.

Definitely a better option. The only thing you might have to check is that some of the older Stars were not 100% Epson-compatible in a few of the commands (possibly including line feed settings). Something like Daisy Dot might require a little bit of tweaking.

Source record: 43429

These cables are easy enough to build with parts readily available at your local radio shack store. You will need a 5pin DIN plug and a cable ending in 2 RCA jacks to plug into your monitor. One of the jacks will be sound and the other will be video, each with a common ground. The pin outs for the monitor jack on your XE are as follows: V
3 o o1
5o o4
2o
1. Composite luminance The pins that you will connect are #2 (common ground),
2. Ground #3 Audio out, and
3. Audio out #4 Composite video
4. Composite video
5. Composite chroma
(not on XL/XE)
I have seen these cables on E-Bay go for $20 and they usually have anywhere between 5 and 20 bidders. I made my cable for around $5 and it took me all of 20 minutes.
Good luck!

Radio Shack used to sell a DIN to RCA adapter which fit the monitor port
and terminated in four RCA plugs. They went for about $5.

Actually, the Chroma output does work on the XE though not on the XL and
you can use split Chroma/Luminance with the XE.

The four-output option is slightly better than using only two wires
because, if you're using a mono monitor, you can run just the luminance
to the monitor and get a much sharper image (blue screen on a green or
amber monitor really sucks).

Actually several '80s magazines including Antic published utilities which could read an ATASCII Listed file and direct the necessary bit mapped output to an Epson GrafTrax or the ever popular NEC 8023A. I have adapted one with major tweaking to send XFormer data to my Epson 24 pin.

G colon device was definitely much easier, more powerful and one of my favorite utilities; I used it with an altered character set to read and print screens from the Championship Lode Runner Disk.

>Eric Chomko chomko@IDT.NET replied:

>And to think I was going to get rid of the Commodore monitor.

It was always the preferred monitor for the 800, not necessarily the most common - most of us settled for a TV..

>I have Anadisk 2.2 (I think). My PC has a 5 1/4" floppy for just this kind >of problem. Is the boot image available? MESS ROMs or some such?

<>

My PC 5.25 has been of very little use here. MyUtil.exe is reported to read/write to MyDOS DD disks in the PC drive - this has not worked much better than Anadisk for me. What I use is a PC 5.25 SSDD 180K and a guy I know with a Happy 1050 which can transfer files to my 8-bit 5.25.

Have e-mailed a bootable image of MyDOS 4.53. The XFormer image is a sequential file of the data from a 720 sector SSSD 90K 8-bit disk. Bytes 1-128 (or 0-127) would be from sector 1 and bytes 129-256 are sector 2... The directory listing is in sector 361 beginning at byte 46081. ATR images are the same after their 16 byte header which can allow them to be larger or smaller than the standard 720 SD 128 byte sectors. If you can port the image data to the 8-bit, you can use the resident disk handler to write it to the correct sectors for a bootable disk.

-Ron

I don't have a solution but I admire the problem.

It's down in there under shows and events, the direct link is:

http://www.icwhen.com/news/septatariswap.html

>Where will the swap meet be located at? What kind of places are there to
>stay at (holiday inn's, etc..) for us far away travelers.

Last year I stayed at the AmeriSuites on Vantage Drive. There are about 7
big hotels right here off the highway with a good price range. Not the
closest places to stay I imagine, but they are very close to the major
highways.

You can get a Yahoo! Map location for the hall at:

http://maps.yahoo.com/py/maps.py?addr=980+Lenore+St&csz=Columbus%2C+Ohio&country=us

Which should be helpful in finding a close hotel =)

Hello Mark,
at ABBUC Germany, they may have some of these carts left. Normally they sell them for 2,50DM (thats about 1 dollar 20 cents) but for oversea shipping the price will be a little higher, I do hope no higher than 10 dollars... Just ask Wolfgang Burger via E-mail for the carts they have - or visit: http://www.atari-computer.de/abbuc
greetings - Andreas

Source record: 43349

[snip]
Hello folks,
if somebody is really willing to do a JPEG to A8 converter here are my
suggestions for graphic modes that should be supported for conversion:

Gr. 8 non-interlaced (320x192, black & white)
Gr. 9 non-interlaced (80x192, 16 greyshades)
Gr. 9+11 non-interlaced (80x96, 256 colors Apac or Apac-2 mode)
Gr. 15 non-interlaced (160x192, 4 colors)

If you want, you could also support a) interlace (for higher resolution)
or b) R,G,B / RGB (unpacked or koala-packed for more colors) graphic
modes. greetingss - Andreas Magenheimer

P.S.: Just a suggestion...

Here's the status of the SID upgrade that I'm working on. I have a complete design, all on hand-drawn schematics. The software is a work in progress and is available from my website: http://www.atari-central.com.

Until I get my Linux system back though the software is at a standstill. I am also working on transferring the SID schematics to a PCB layout which I will upload to my website as well.

The PAL .JED files are also available from my website for the five PALs that are in the circuit.

The SID device is a PBI device... so you won't need to open your Atari at all.

Message-ID: <f_1d5.1128$s7.133721@typhoon.sonic.net>
Source record: 43351

And it sucks! I recently moved from a pretty nice
apartment in Davis, CA to a rather trashed house.
(They're working on repairing it, but in the
meantime we're stuck eating out and showering
at friends' places!)

Anyway, I did a search on AltaVista for my
old address, and it seems it's listed mostly on
Atari FAQ's and some sites listing Atari
developers (although I admit I've done nothing
Atari 8-bit-wise in far-too-long).

Anyway, to all those who have my old address:

919 Drake Drive #147...

My new address is:

1509 Cypress Lane
Davis CA 95616-1317

-bill!
(who needs to get his 1200XL back from Bob Woolley
before the millenium officially ends ;))

4383. Conflicting Information. <Please help>

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-18 00:00:00 UTC
From: av999@freenet.carleton.ca
Message-ID: <3974B723.E6860648@freenet.carleton.ca>
Source record: 43352

Thanks for the information, Andreas. One of the reasons I'm getting confused is because of conflicting information. I pulled this information from the Atari 8-bit FAQ:

"Software written for NTSC (North America) will always work on PAL machines,
but software designed on PAL machines (Europe) won't necessarily work on NTSC machines.

Wayne Booth, mailto:trek@ihgp15.ih.att.com writes:

The differences with PAL and NTSC have to do with the number of lines displayed on the screen and whether they are using 50 or 60 Hertz.

If I remember correctly, I believe PAL has 625 lines/screen and they refresh the screen 50 times a second doing 1/2 the lines each refresh so they effectively repaint the screen 25 times a second. NTSC is 525 lines/screen with a 60 times a second refresh - again only half the lines each refresh so a 30 times a second frame rate. This would change the amount of time available during vertical sync pulse, and the number of lines that need to be redrawn each time.

Graham Thornton, mailto:nero@chicagonet.net adds:

I use both a real PAL Atari 800 and a PAL-ANTIC 1200XL here in the US.

Replacing the ANTIC chip with a PAL version changes the screen refresh rate
to 50Hz which allows most of the PAL-only European software to run. Your system will still report itself as a NTSC machine, unless you change the ROM (see the Nir Dary upgrade), but most software doesn't care.

The one problem you might run into is your monitor. Replacing the ANTIC will mean your North-American Atari is now generating an NTSC signal at 50Hz, instead of the usual 60Hz. Some people will tell you that modern TVs
and monitors don't care but that isn't actually true. My brand-new Sony Trinitron 15" colour TV/monitor goes bezerk with the upgraded 1200XL, but

my 15-year old 10" Texas Instruments color monitor (designed for the TI-99/4A) is fine.

You can also use real European equipment here in North America, provided that you have a PAL-compatible TV/monitor. The frequency of the power system is irrelevant, as I use my 800 with a 110V/60Hz 1050 power supply"

This seems to conflict with what you and others say.

Sorry to be such a pain. I just need to know an exact answer. Has anyone on this board in North America successfully run PAL Atari 8-bit carts on their NTSC machine?

Thanks,

Mark

Hi there,
game music is very close to my heart-interested to hear anybody elses
favourites..
Gary Gilbertson is one of the great unsung heroes imho
he did the tunes for alternate reality, tail of beta lyrae, monster
smash & (i think)
mr robot(full disk version) & cosmic tunnels-I dont think any of the
emulators
play most of these tunes accurately as yet although I hope the Sap
player will 1 day.
I seem to recall a lot of these tunes were on a 'music master 2' demo
disc-is it knocking about on the net anywhere I wonder?? Would
appreciate any info or corrections-replace 'localhost' with 'stayfree'
to reply.
Btw I remember someone telling me the disc version of bruce lee had
music?
Is this true?

What is needed to restore circuits on mylar, or a circuit board is a substance called
Nickel Print. It can be obtained from a good electronics supply store, mainly one that carries all sorts of Radio, TV and Computer components. Not RADIO SHACK!!

This will do all elements,car window heat traces 130xe, traces for broken traces to specific keys, you put it on not with the brush it comes with as it is about a 1/4 inch wide, use a needle after bottle shaken to get all eliminates mixed and after cleaning the surface lightly re-trace the trace and let it dry completely before doing a circuit test. It's cost is in the area for $5.00-$7.00. You could also use a compound called liquid silver to be found in a tube, this is more expensive but the nickel will do just as well for less, and lasts much longer in the bottle and on the board.

This post states 130XE Keyboard? There is an upgrade that requires 4 3600k resistors to be placed on the Help, Select, Start, Option keys that will eliminate problems pressing these keys requires small soldering iron but still cheaper than replacing the keyboard.

Source record: 43358

The 1027 Printer has a roller, if you go get some ink pad ink in a bottle and pull your roller out and run the bottle head across it several times you will re-ink the roller It can not hurt the printer as each item strikes the paper separately and runs across the roller prior to typing on the paper. This is the worst printer Atari ever put out, The manual for repair manual states replace the whole mech. when you have a problem

When they work they do a slow job, if it works put it away for your grandchildren to collect some antique value?

Get an Epson through an interface or other printer to do graphics ect?

Getting close to retireing from my regular job! I still have a bunch of Atari Items and
have a Digital Camera. If there is an item I still have in my posession would be will ing to take a photaograph of it and send it somewhere? IE: I have an original copy of an Intgerace produced for the Supra Hard Drive Intercace for the Atari 8-bit, and also a copy I can scan in after I bought the rights. Also have the ability to captrue screens from a VHS VCR shown on the tv at the same time. So those of you with time on your hands do this, make a cable to access your VCR through your Atari 8-bit. Audio in and audio out. Plug this cable into your Atari that will accept a video cable, then turn on your vcr to record, and play anything you want to record on the vcr. Tape the session and you can pull frame for frame off the vcr to your IBM in any format JPG, BMP ect!

Been there done that..

I have to agree with the original response to this thread. Astro Chase was an awesome game. So far ahead of its time.

Now I will throw in another. How about Raid over Moscow. This game kept me glued to the screen for hours. Any other Raid over Moscow fans?

Also, just to clarify things. Behind Jaggi Lines was the beta, unfinished (not debugged) version of Rescue on Fractalus. Apparently a disgruntled employee released it into the public domain. I remember that it really hurt sales. Rescue on Fractalus was another piece of original software. It was the very first implementation of gaming for the masses based on fractal geometry.

Oh, and Ballblazer (funky jazzy stuff). I thought Ballblaster was cool, but it lacks the jazziness (is that a word?)

Masters of Time had REALLY cool music - very electronica. Warhawk had
one of the few Rob Hubbard soundtracks, hadn't it?

Oh, and I really liked the funky tunes in Spinnaker Aerobics. Ahem. :)

Not true. the Pal Flag is in the Gtia chip, not in rom. The ntsc and
PAL roms are the same. Only Rev A rom was had different versions. I am
not sure if rev B roms Had seperate versions.

Tail of Beta Lyrae was probably the best in graphics and music when you
talk about Atari 8-bit games. Of course Ultima 3 had excellent MIDI music.

Hello there,

(and sorry about the intrusion!)
I just want to inform anyone interested in classic adventure games that I've opened a
discussion board on my site. The service has just been added, which means that there haven't been a great deal of posts - yet! All that will hopefully change over time, and hopefully you can also be part of changing that.

Of course, there's always rec.games.int-fiction, but I have a feeling that 8-bit gamers not playing Infocom games don't have a lot to do there these days.

So, feel free to join the discussion, whether you're looking for help or just someone with similar interests.

As a final notice, even if you're not into discussion, there's plenty of hints, maps, solutions and more on the site.

Hope to see you soon!

4419. Refurbishing a 1050

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-20 00:00:00 UTC
From: Mark Keates <mark@mkeates.force9.co.uk>
Message-ID: <jFHd5.6405$l5.411815@stones>
Source record: 43300

Hi,

I've recently got around to getting a 1050-2-PC cable built
but I'm having trouble with reading disks. I've got a high
suspicion that it is the drive as I haven't used it in a long time.
I'm moving house next Friday, after which I can try the drive
direct on an 800XL to confirm this (its stored at my parents
at the moment ;-) The cable itself appears to be fine as the
odd sector is coming through.

After searching on the internet I've not come across a guide to
'cleaning' a drive or for aligning the head (if this is necessary).

Can anyone explain how this is best done, or the name of
someone in the Berkshire (UK) area who refurbishes drives.

Cheers,

Mark

Sure did, Adam Gilmore working for Zeppelin games. Infact he wrote music for
a lot of their titles. (Sometimes the music was better than the game though
!!!)

Paul

At one time I had 8-bit Atari's, I still think they have untapped
potential. I wanted to port my jpeg viewer to ACTION! as I think
it will work and I've used it before. I don't have a version
of ACTION! that will function on any 8-bit emulators I have, or
a real 8-bit for that matter. A freind of mine has 8-bits
and mentioned he might one day try to port it.
I wish he would! Hope he sees this post. hehe

>(drive 1), D2 (drive 2) and so forth.

Depends on which DOS is in use if you are at the DOS prompt or in an
application; D1: or D2: etc. must usually be in your file specification

> Read from a drive?
>A: In the DOS menu you can select the drive command by hitting the number,
>and the load command to load a particular file.

This is a broad question; a file or file listing? Menu driven DOS's use a
letter; command line types expect input like "DIR". Most allow you to "C"opy
files to the screen ("E:") as a device.

> Write a file?
>A: In DOS you have the copy and duplicate disk commands.
>Save a file from basic?
>A: save "d1:name.ext" (should give you an idea of how to write out the
>command.)

Most BASICs demand upper case as in SAVE "D2:NAME.EXT"

>How to list disk files without being in DOS? .
>Wouldn't mind knowing that one myself. :) .
>Doctor Clu

Here is one solution:
CLOSE #1:OPEN #1,6,0,"D2:*.*":FOR L=1 TO 1300:GET#1,B:? CHR$(B);:NEXT L
Don't omit the semicolon. There is no string to dimension and shorter to type
with abbreviations (CL. O. F. N.); you can keep it at a high line number in
memory and use G.32000. I normally use 999 (quick to type) but a full MyDOS
4.54 disk can approach 12-1300 characters; you can limit the list with a mask
like D:*.BAS or D3:M*.* in the open command. Replace "6" with a "4" and you can
read the specified file on screen up to the number of letters requested. It is
similar in Assembler but there is a lot of LDA, STA & JSR stuff in the lower
level language...

-Ron

I don't have a solution but I admire the problem.

>'cleaning' a drive or for aligning the head (if this is necessary).
>Can anyone explain how this is best done, or the name of
>someone in the Berkshire (UK) area who refurbishes drives.

I have seen in the distant past some info re: aligning the head by trial and error after replacing the zero track sensor or stepper motor linkage, but have not relocated it.

Most 5 1/4's are getting along in years now and many are beginning to lose some of the oxide coating which clogs drive heads. A good cleaning should be the first step before tinkering with the mechanics which is rarely needed if the drive has not been dropped or suffered similar shocks.

Head cleaner disks are sparse and usually too abrasive for me; a Q-tip or lint free swab and some denatured or 70% isopropyl alcohol is normally satisfactory. You WILL need to remove the top from the 1050 for access. The head is on the bottom (below the floppy) with just the pressure pad above. Allow everything to dry (15 seconds or so? alcohol should evaporate quickly) before testing. It will probably read like a new one.

I update my catalogs once a week. Just before this message is posted. So when you see a new posting, check my Catalogs. After I post this message. I'm off for the weekend. But I'll be back after the weekend.

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and Accessories for Classic 8 Bit and Atari ST. Plus I've just branched out into Atari Jaguar Hardware & Games. So checkout what's new on my Web Site. In Fact, check it regularly as my Catalogs are updated regularly. Customer's are served, first come, first serve! No competing in auctions. Just Sales, Support & Service! I have 8 different Catalogs, & my SoftWare Catalogs are my largest. They have the biggest Byte Count. You should see my inventory! I have TruckLoads of HardWare, Boxes and Boxes of Software & Libraries of Books & Reference Material for the Classic Atari 8 Bit, Atari ST & the Atari 64 Bit Jaguar Game Machine! And remember, if you can't come see me today, come see me tomorrow!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari 64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net & Jump to my FTP site linked to my WebSite so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor & view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend.

Richard,
You bring up a good point. Time will tell in the next round of games if this trend of classic games is a committment or a fluke. .
Honestly, what I would like to see happen is Atari (as it currently is under hasbro) release a classic title here and there as well as make a new game from time to time that is totally unique to this decade. A little old with a little new. .
I think this is mot likely the best solution. Being that Atari has found great success in the current day doing this, I don't see why they would quit anytime soon.

VS,
Out of curiousity, what is the computer that you sending files from the Atari computer to? A PC, Mac, ST .... :) .
In this day and age, though null modem and diskformer are good solutions, have you considered Steve Tucker's ape interface programs and SIO2PC cable? That would be the PC solution. ST world has a similar solution.
The Mac world is still lacking on this one. .
As for the Rhandler, what kind of serial interface were you using again? (Gotta forgive me, using Ice-T on an Atari 800 so I have to go on memory on what the previous message said.) :) Usually bobterm will come with various handlers, but I think in the end, I took the Rhandler off of the Ice-T achieve disk to run both Bobterm and Ice-T. They are both great programs. Wish there was a way to have the 80 columns of Ice-T and the macros of Bobterm. Oh well.

On Wed, 20 Jul 2000, Greg Goodwin wrote:

> How to list disk files without being in DOS? .
> Wouldn't mind knowing that one myself. :) .

If you want to use a program:

```
10 CLOSE #1
20 OPEN #1,6,0,"D1:*.*"
30 DIM L$(20)
40 TRAP 80
50 INPUT #1,L$
60 PRINT L$
70 GOTO 50
80 END
```

Without using a program:

```
CL.#1:O.#1,6,0,"D1:*.*":DIML$(20):F.X=0TO1:I.#1,L$:?L$:X=(L$(2)<>" "):N.X:END
```

[NB if linewrap kicked in, the above is all one line]

This method is rather arcane, but is the only way I know to avoid ending
with an error condition. It uses a for-next loop where the counter is
continually reset to 0 until the second character in the input string
is not a space i.e. the seconf digit in the "Free sectors" line. Also, to
be sure it works always, add "CLR:" before the string dimension.

You can dress these up by adjusting screen margin and using a semicolon
after the print statement to get a double column display.

You can also save the immediate statement in straight ATASCII without a
line number and then at any time Enter it from disk. As it has no line
number, it will not affect any program listing already in RAM.

Of course, the really easy way is to use Turbo BASIC :)

When I got my 1050-2-PC cable I tried it on a NT system. The effect
was that the first few sectors were read (up to even fifty
sometimes) and then it got out of sync and couldn't read any more
sectors. In Nicks FAQ I found that the same is true for Win95.
Now I have Win98 on my PC and everything works quite good.
Only sometimes there are read errors from the first sector on.
Then I have to switch off my 1050 and afterwards it can read the
disk.

feel free to contact me if anything's unclear

Gerhard

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System.

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari
newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st. The
Atari computers themselves have been around since 1979.

There is no charter for comp.sys.atari.8bit. (newsgroup pre-dates the custom)

comp.sys.atari.8bit is not moderated.

DO NOT POST BINARIES in comp.sys.atari.8bit, use the binaries groups instead.

4445. Atari Manuals

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-21 00:00:00 UTC
From: Steve Breech <sbreech@columbus.rr.com>
Message-ID: <GkVd5.4160$u56.56335@typhoon.columbus.rr.com>
Source record: 43312

Is there any place I can download the original user's manuals for an atari
XF-551 and for an Atari 1010 Program Recorder? I just bought these 2 pieces
of equipment, and I would like as much info about them as possible.
Thanks!
Steve.

Steve
The 1010 "manual" doesn't really tell you any more than you could work out from pressing the buttons, but I could scan it in and email it to you if you want?

4447. Re: Searching for years for 2 games

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-21 00:00:00 UTC
From: Stephen Knox <gooch@erols.comX>
Message-ID: <3978378D.148972D5@erols.comX>
Source record: 43314

Were they released by Epyx????

If you're mentioning the games I think you are, they were by Scott Adams???
They were his first adventure games. They were redefined character set
graphics where you were a 1 character dude moving via joystick around a
large scrolling world.

2 things come to mind about these games:

1. Escape from Vulcan Island needed a flare gun to win
2. The Haunted House one had 'Bats in the Belfry'

Does that ring a bell? I have Escape from Vulcan Island on disk and I
believe the King Authur one, but alas my 8bit stuff is boxed until my
basement gets finished :(

I' like to get the Haunted House one back though.
--
Thanks,

Stephen Knox

4448. To the searchers of Epyx games

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-21 00:00:00 UTC
From: "Vidar \"Hawk\" Olavesen" <olavese@online.no>
Message-ID: <QPZd5.17942$MS3.324981@news1.online.no>
Source record: 43315

I put the games up on my site at : http://home.online.no/~olavese/
Go to Atari (the logo) and select Atari 8-bit (640*480 users must scroll sideways). Then click the download section and select which games you want. Some of them have more than one game on the disk. Like Rescue on Rigel (or something) and such.

Direct link to download : http://home.online.no/~olavese/atari/a8dl.htm

Hope this helps some of you. Games are Crypts of the Undead, King Arthur's Heir, Escape from Vulcans Isle, The Nightmare, Indiana Jones in the Pyramids of Giza.

Enjoy!

Bruce Lee has music on my tape version too I think. Haven't tested it in a while (15 years or so)

I agree with the issue of Gilbertson, he's great! Passionately demo and the Antic demo. Great! Best was Alternate Reality : The City.

4450. Announcement: cc65 v2.5 released

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-21 00:00:00 UTC
From: uz@musoftware.de
Message-ID: <8l9t4aesa1@mauli.musoftware.de>
Source record: 43317
Cross-posted to: comp.sys.cbm,comp.sys.atari.8bit,comp.sys.apple2.programmer

I'm proud to announce version 2.5 of CC65, a C crosscompiler /
crossassembler combo for 6502 systems.

CC65 has C and runtime library support for many of the old 6502 machines.
The libraries are fairly portable, so creating a version for other 6502s
shouldn't be too much work.

Here is a list of the compiler features:

* Includes a C compiler, macro assembler, archiver, linker, GEOS
resource compiler and a frontend (compile & link) utility. The
assembler generates relocatable object files, the linker is very
configurable and allows overlays, ROMable code, split output and
much more.

* The compiler is not quite ISO compatible, however, a large subset
is supported.

* Supported target systems are:

- C64
- C128
- C16, C116, Plus/4
- CBM 600/700 family (programs run in bank 1)
- Newer PET machines (not 2001)
- The Apple][(thanks to Kevin Ruland <kevin@rodin.wustl.edu>)
- The Atari 8 bit machines
- GEOS for the C64 and C128

For all these systems a precompiled runtime and C library is
available. Supporting more targets is not very difficult since the C
library was written with portability in mind.

* Several system specific support routines like a conio library or
modules for joystick access are available.

* The assembler and linker do also support the 65816 as a target,
however, the compiler is not able to generate code for this CPU and
there is no RTL support.

* Lots of docs and a few sample programs included.

* Easy interfacing between C code and assembler.

* Fullscreen debugger for most machines as a linkable module.

* Full sourcecode available as well as binaries for

- Linux (several RedHat RPMs)
- DOS
- Windows 95/98/NT

What is new in this version:

* As usual many bugs fixed (and new ones introduced, so it does not get boring:-).

* New -j switch to make the default character signed. New #pragma to do the same.

* Slightly better code in some situations.

* A lot of new features for the assembler:

- Unnamed labels
- Several emulation features
- Listing support
- New builtin functions
- Include file search path support

* The linker generates an imports list in the map file.

* Completely rewritten symbol table handling for the compiler.

* Lots of code cleanups. One result of this is that the -T option does now work without clobbering the output in some cases as it was before.

* Much more code is now shared between the tools.

* Experimental 65C02 support for the compiler.

* Support for the Atari 8 bit machines was contributed by the Atari team:

Christian Groessler <cpg@aladdin.de>
Mark Keates <markk@dendrite.co.uk>
Freddy Offenga <F.Offenga@student.kun.nl>
David Lloyd <dmlloyd@atari-central.com>

* It is now possible to write GEOS programs for the C64 and C128 using cc65, thanks to the GEOSLib library contributed by

Maciej Witkowiak (YTM/Elysium) <ytm@friko.onet.pl>

* Documentation updates.

* More minor changes.

Support for some features is still missing. To name a few:

* No floats, no bit fields.

* No file routines on most systems. The 8 bit Ataris are the first machines that do have full file I/O support (besides the ACE port which was dropped some time ago). Please note that the complete CBM

family doesn't have file I/O support!

* The 80 column mode on the C128 is not supported by the conio library.

More information:

For your convenience, I've put all doc files also on the web server:

http://www.von-bassewitz.de/uz/cc65/doc/

The cc65 main page

http://www.von-bassewitz.de/uz/cc65/

will get updated to reflect the new version in the next few days.

There is also a cc65 mailing list. To subscribe, send a mail to
majordomo@musoftware.de with the command

subscribe cc65

in the body of the mail.

Available packages:

As usual I will provide the complete sources and several binary packages.
There are some binary RPMs for different versions of RedHat Linux, which
is probably one of the fastest ways to get going. Since Linux is also my
development platform, new features and bug fixes are first available for
Linux.

Binaries for DOS and and Windows will follow or may already be available
at the time you read this. While the sources do still compile under OS/2,
I have dropped support for OS/2 binaries, since were almost no downloads
of the OS/2 version.

Download:

For more information and links to the FTP server, see

http://www.von-bassewitz.de/uz/cc65/

For direct download, use

ftp://ftp.musoftware.de/pub/uz/cc65/

Thanks to all who sent feedback and suggestions!

FamilyNet HQ: Telnet:\\www.family-bbs.net

I was working on my Newton MessagePad this week, and though much improved,
my really cool desktop backdrop, the cover art for Archon, was lost. :(

Anyone know where I can find a scan of this on the internet so I can
make another desktop backdrop?

Thanks,

Doctor Clu

Both games requested were stamped with their name, EPYX, and Atari 400/800
right on them. The game called the Nightmare did have a room with bats in
the belfry....and yes, in both games you did scroll around in a large world.
I think I have both of the games now, but I will not know for sure until I
get my Atari's up and running in my new house....apartment is WAY too small!
Steve.

It's unbelievable - Ebay is rife with such classic Atari mags as Antic or Compute, but despite months of checking, not a single listing (that I could find) of IMO the best 8-bit mag ever: Analog.

Any suggestions on where to find some? I'd love to plug the holes in my collection. Anyone here looking to dump some of their own should contact me - I guarantee I'll take them off your hands if I don't already own them.

Mike

I have the 3 - 16k RAM modules and 1 -10k ROM module up for auction.
Ive pretty much sold all of my 8bit hardware except for these items and
some software and books that will be added soon. I would like to see
these items get to some one that needs them or wants them. The auction
staring price is $1.00

> Bruce Lee has music on my tape version too I think. Haven't tested it in a
> while (15 years or so)

I could be wrong, but I am pretty sure that the Bruce Lee tape for the
Atari 400/800/XL/XE computer does not have music. It could be that
it has some kind of sound while one is at the title screen.

I remember this because I and a friend who owned a Commodore 64
compared the implementation of the games. The 64 version had music.
It sounded like a Salvation Army song, nothing exciting, but anyway.

> I agree with the issue of Gilbertson, he's great! Passionately demo and
the
> Antic demo. Great! Best was Alternate Reality : The City.

I agree! I did not know who made the music in the games mentioned until I
read this thread. The catchy, swaying tune in in Cosmic Tunnels is great and
very suitable as an original (?) computer games theme.

Finally, a look to the dark side. The worst Atari game theme must be
the title song in Thorn EMI's Carnival Massacre. Thorn EMI also
offered the next worse song: The title song from Darts.

If there is a connection between Thorn EMI and a company called
Creative Sparks, the Atari implementation of Desmond's Dungeon with
its cool tune makes up for the terrible music in Carnival Massacre and
Darts.

Resue at Rigel is one of my favorites. It is atmospheric, yet cheesy.
You have to learn the key-strokes for R@R. Turn out the lights and
play this one by the light of the monitor screen. Watch out for deadly
High Tollahs and Cerbanths.

You can talk to Common Tollahs. I think the underlying theme of R@R is
the oppressive regime of the Rigellian government.

If the action gets too heavy, you can beam up. Have a great day and
say hi to Smitty for me!

VS

4461. Laser Chess?

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-22 00:00:00 UTC
From: Blair Bingham <bebing@bellatlantic.net>
Message-ID: <3979B729.CF91DCC2@bellatlantic.net>
Source record: 43328

Does anybody remember a Laser Chess type of game? It may have
even been a Antic or Analog game. It may even have been done in
BASIC. It was a basic chess grid with pieces and after you moved
you would fire your lazer and it would bounce off of 'mirrors' at right
angles, finally obliterating your opponent if you planned right. It was
surprisingly addictive.

It was actually published in Compute! around 1987/88 (I've got them
packed away so I can't look for the exact issue) and was in BASIC.

It was a type in ML programme from Compute! I believe.

Thinking back, you may be right about the BASIC (with a bunch of ML routines contained therein).

If my memory is not failing me, they had a competition for user written programmes and LaserChess was the winner. There were several type in versions for different platforms (converted from the original submission to their contest - was the original submission an AtariST version? For some reason I have a memory that was the case).

Okay, this worked well for Diskformer, thanks!

I can run Diskformer and write ATR's from PC directly over to Atari
800 floppy drive. Woohoo!

I am not able to make the darn 850 dial out with IceT, or Ken Siders'
TESTTCP program....

Telelink II cartridge dials out fine though.

VS

4470. Ice T Questions

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-22 00:00:00 UTC
From: NOSvelcro@netunlimited.netPAM
Message-ID: <3979f3e7.9763091@news.netunlimited.net>
Source record: 43337

I installed the R-Handler for my 850 with standard Intel modem
attached but am still having trouble dialing out for some reason.

IceT loads fine (and doesn't stop me at a "no R-handler message) like
it used to, but when I go into the TERMINAL screen to type ATDT and
the phone number the keyboard just clicks but no characters appear on
the screen and nothing happens.

Am I missing some obvious dial command in Ice-T?

VS

Does anyone know if this had any relation to the Amiga game of the same
name? I played this on my little brother's Amiga a few times, and yes,
it was quite interesting. If there was an Atari 8-bit version, I'm
surprised to hear it... Shame it wasn't on cartridge. :-)

Vidar> Bruce Lee has music on my tape version too I think. Haven't
Vidar> tested it in a while (15 years or so)

I could be wrong, but I am pretty sure that the Bruce Lee tape for the Atari 400/800/XL/XE computer does not have music. It could be that it has some kind of sound while one is at the title screen.

I remember this because I and a friend who owned a Commodore 64 compared the implementation of the games. The 64 version had music. It sounded like a Salvation Army song, nothing exciting, but anyway.

Vidar> I agree with the issue of Gilbertson, he's great! Passionately demo
Vidar> and the Antic demo. Great! Best was Alternate Reality : The City.

I agree! I did not know who made the music in the games mentioned until I read this thread. The catchy, swaying tune in in Cosmic Tunnels is great and very suitable as an original (?) computer games theme.

Finally, a look to the dark side. The worst Atari game theme must be the title song in Thorn EMI's Carnival Massacre. Thorn EMI also offered the next worse song: The title song from Darts.

If there is a connection between Thorn EMI and a company called Creative Sparks, the Atari implementation of Desmond's Dungeon with its cool tune makes up for the terrible music in Carnival Massacre and Darts.

Atari 8-bit Magazines for Sale

Wife says rest of collection must go! Basically looking for a good home for these items. Not trying to make money, but to cover costs.

Lot 1 - $20 - 15 inches thick and weighs 40 lbs - Shipping is extra! (It may cost more than the actual items. <grin>)

Antic - Complete set for $20 (81 issues)
April '82 (vol 2, no 1) through Jun/Jul '90 (vol 9, no 2) (complete except first year)

Lot 2 - $10 - 7 inches thick and weighs 16 lbs - Shipping is extra! (It may cost more than the actual items. <grin>)

Atari Classics - 15 issues
Dec '92 (vol 1, no 1) to Fall 1996 (vol 5, no 2)

Atari Interface Magazine - 4 issues
Apr '92 through Jul '92

AtariUser - 4 issues
Aug '91, Sep '91, Jan '92, Feb '92

Current Notes - Last issue (vol 15, no 3) - (I'm the former 8-bit Editor.)

New Atari User - 22 issues
Dec/Jan '89 (Issue 41) through Oct/Nov '92 (Issue 58)
Feb/Mar '93 (Issue 60) through Aug/Sep '93 (Issue 63)

Orphaned Computer Game Systems - 4 issues
Vol 1, Issue 1 through Vol 2, Issue 1

4477. Best Atari sound effects

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-23 00:00:00 UTC
From: ANDERS SKELANDER <anders.skelander@swipnet.se>
Message-ID: <wpDe5.19196$rH5.43261@nntpserver.swip.net>
Source record: 43249

While reading the thread about best game music on the Atari computer
I recalled some impressive sound effects too.

1. The drum sound when you do a home run (?) in Starleague Baseball. I
do not like baseball so much so I did not hear this massive drum sound
until a friend who was more into the game asked me to listen.

2. The barking ('yap yap') sound in Llamasoft's Hovver Bovver.

3. Maybe not so realistic but still nice: The sound effects for yelling
people, barking dogs and yeowww-ing kittens in Synapse's Alley Cat.

First of all, make sure the Keyclick setting is set to "simple" or "none" (I really must address this bug sooner or later..). This doesn't seem like your problem though.

Second, does your modem work properly with other communications software or is it just Ice-T you're tried? If you haven't tried anything else, check your connections and your settings. You're supposed to see everything you type echoed back to you from the modem (with the setting "Local Echo" set to OFF).

If your modem has LED indicators check that the TX and RX light up when you press keys on the keyboard. Make sure your baud rate setting is right for the modem. Check the cables.

Source record: 43257

You can try the things Itay said.
You said in another thread about diskformer program that you got that
to work with your handler, and telelink II dialed out ok.
So, I don't think it is your handler.
I don't remember Ice-T much. But I think BobTerm has a setting
for ASCII or ATASCII. Set that to ASCII, because ATASCII
EOLs won't work your modem. You should see the letters you type.
Set duplex to half to (local echo on).
Finally try bringing the speed down. I don't know what the default
is with IceT but try 4800 or tops 9600.
Can you try BobTerm with the above suggestions and see if you can
get the modem to respond?
Then you said you're using a standard Intel modem. US Robotics,
Hayes, Cardinal, I've heard of. I've never heard of an Intel modem.
It is probably a modern one. A 56k one. Your Atari can't do above
9600 reliably, 19200 is absolute tops and you shouldn't try that until
you get 4800 working. But the modem will probably respond.
Try typing at ENTER several times, just to get the OK from the modem.
I doubt you'll see the LEDs when typing, but maybe.
Russg

4487. ANNOUCE: Old Hacker's Atari User Group newsletters

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-23 00:00:00 UTC
From: Kevin Savetz <savetz@northcoast.com>
Message-ID: <savetz-ED711E.20103723072000@news.northcoast.com>
Source record: 43259

A nearly complete archive of newsletters from the
Old Hacker's Atari User Group is now available at
http://www.atariarchives.org/oldhackers/

The site contains downloadable versions of the
group's newsletter disks from 1990 through 2000.
Disks are available in ATR, DCM, and ZIP formats.
Each newsletter contains original articles plus a
selection of software.

Due to declining membership, The Ol' Hackers Atari
Users Group will close its doors after its final
meeting in December 2000, but the newsletter archive
will remain.

Hey all. This is just a little self-promotional announcement. I'm the
moderator of comp.sys.atari.announce, a newsgroup dedicated to
news about Atari computers. It's a low-volume newsgroup with
occasional news of interest to 8-bit, ST/TT/Falcon, Portfolio,
and other Atari computer folks.

Subscribe, read, enjoy. And next time you have some Atari news to share,
post.

See you at CGExpo,

4489. ANNOUNNCE: Atari XL/XE ROM source code (rev. 2) available

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-23 00:00:00 UTC
From: Sidney Cadot <sidney@janis.pds.tudelft.nl>
Message-ID: <397A5F8F.D27FEC71@janis.pds.tudelft.nl>
Source record: 43341

Hi everybody,

I am happy to announce the availability of the Atari XL/XE ROM
reverse-engineered source code, rev. 2. This latest version uses the
CC65 compiler suite, which includes a blindingly fast macro-assembler
and linker. The packages comprises 7 source files (13887 lines of
assembly) that can be assembled and linked in 0.3 seconds (!) to yield
ATARIXL.ROM and ATARIBAS.ROM, as used in several emulators that are
available.

You may find the package on my Atari web-page at:

http://ch.twi.tudelft.nl/~sidney/atari

I'd appreciate any comments you may have, and I would also like to
mention that I would welcome outside involvement for improving the
quality of the source-level comments in the code.

Best regards,

Sidney Cadot
sidney@ch.twi.tudelft.nl

Got them (after 17 years)! Thanks!!
What emulator do you recommend? I've got xformer 2000 and it runs Crypt
fine, but I can't get Nightmare to go. I'm probably doing it wrong -
any ideas? Thanks.

I picked up an 800xl with the disk drive at a flea market last
week. It came with a box of disks with loads of games on
them...problem is when i load the disks i get a games menu then
pick a game but nothing comes up. Do these disks go bad after
time? Is there anything i can do to get these to work?

Thanks,
Mike

Sorry, I hate emulators, I need the real thing. Hmmm. They should be about
the same, boot with basic. They are mostly the same type, so I don't know
why one should run and the other not. Tried XLIT ?

Disks do go bad after a time, but since you see the menu, I suppose
you should try booting with the option key held down (one of those
big silver keys on the right side of the keyboard). This will dissable
the BASIC ROM.

4494. Re: Ice T Questions

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-24 00:00:00 UTC
From: NOSvelcro@netunlimited.netPAM
Message-ID: <397b8601.347758@news.netunlimited.net>
Source record: 43261

Well, it is a pleasure to get an answer from the person who actually
wrote the program. I should off on praising Ice-T until I have
actually used it a few times, but must mention that the implementation
of 80 columns through a narrow font is quite amazing. Also the
drop-down menu layout and smooth scrolling was something I never
thought I would see on an 8bit Atari.

The problems I am having are strictly with the R-handler and have
nothing to do with Ice-T. For some reason, the R-handler doesn't want
to run the modem, although I can transfer files from another computer
by way of the null-modem cable.

I have another handler I found that might work ATARIRS.232 but I
haven't tried it yet. I am sure I will post something to let you know
when I successfully test Ken Sider's TCP/IP stack which is the whole
point of this really.

Boot with MyDOS 4.5 and attempt to set density to double; if it configures you have one.
Optionally boot SpartaDOS and attempt to format in double density; once again - if it does then you have.

-Ron

I don't have a solution but I admire the problem.

Got it, and it does work -- inasmuch as I've been able to test it.
(It loads and is able to play fine, anyway)

>Datasoft BASIC compiler.

No dice here that I can see.

>Any other BASIC compiler.

Are you looking for a compilable BASIC flavour such as Turbo Basic, or
an actual program that'll compile regular Atari BASIC code? Either
way, I have Turbo Basic (regular and extra-crispy-Sparta-compatible
flavour, including compiler), and the MMG Atari BASIC compiler. These
are not ATRs, but rather actual 8-bit ARCs. You can UnARC using your
favourite PC unarc util, or PowerArchiver for Win32, which handles
practically anything, and then either use Atari800/XL-It!'s H: handler
to access the local PC hard disk, or use an emu utility to copy them
on to an ATR/XFD image.

>Any program which drives a mouse. RAOS?

I have a BASIC program that'll drive a mouse (intended for application
development), as well as a ROM image of the DiamondOS cart.

Alley Cat had some of the best background music and sound effects, as
far as I'm concerned. Very clever use of Pokey, there, and some quite
realistic (if cartooney) sounds there for non-digitized sound effects.

However, I have to say that World Championship Karate had some very
excellent sound in it, as well as music and graphics.

Try formatting a disk to double density using ultraspeed sector skew.
If it works, you've got a US Doubler. If not, it's a happy.

Well, I haven't found any that runs my PAL demos. Can you make my PAL demos run on any of the emulators ? They're located at the same place the EPYX ATR's are.

http://home.online.no/~olavese/atari/a8dl.htm

Please let me know the settings you use, if you can make them run.

BTW : They don't run on real NTSC computers either.

I had no problems running all of them in Atari800Win V2.5c (V2.6a has buggy sound) with
th following settings:

Machine type: 800 OS-B
Display: PAL
Enable SIO patch: off
Allow ROM patches: off

Also try searching for the following mouse programs:
- A8 GUI`s (SAM, Diamond GOS, GOE and other PD`s)
- Operation Blood (polish game)
- Special Forces (Op. Blood 2)
- The Brundles (Lemmings for XL/XE)
- Brundles Editor (Level-Editor, PD!)
- Minesweeper (you know that! german program)
- Bombdown (another Minesweeper, german of course!)
- Geisterschloss (Ghost castle, german arcade)
- Missile Command (Control+T for mouse/trackball mode; works good with
my silver XL cart and built-in XEGS game, mouse mode does not work at
all with old and brown/orange A800 cartridge)
- some tools, like graphic converters (forgot their names- PD!)
- Multi-Mouse Driver (for many input devices, also supports ST and Amiga
mouse, besides Trackball, Joystick, Touch Tablet and others)
- and many more programs... (some 10-12 appeared in KE-Soft`s german
ZONG magazine, mostly arcade games everyone can play)
```

Source record: 43274

[snip]
Hello Richard,
best Atari game music - thats rather difficult, since I just recorded 7 CD`s with Atari game sounds. Every CD holds 36 sounds and plays about 60 minutes. Overall thats 252 sounds (will still record CD number 8, 9 and 10 if I find more Atari game sounds).

Most older game sounds (1979-1983/84) are rather bad, whereas almost all Zeppelin and Mastertronic game sounds are nice (I still recorded all sounds I could find onto CD). Besides that I was surprised with the old sounds of Necromancer, Beta Lyrae, Blue Max 2001, Nadral, Dimension X and other games. I am currently searching for sound demos that have the sounds of Ultima (1-4), Phantasie (1+2) and other games in it, which I do not own.

(I own some 250 original games plus searched through many different sound demos, like Music Master 1+2+3, Big-Demo, Music Hall 1988 and 1989, Music Kaleidoscope and many many others; looks like no sound-demo includes the sound of Ultima...)

greetings - Andreas Magenheimer

I guess you're saying the R: handler you used with diskformer worked
a null modem cable and not the modem. If it works with diskformer
setup, it should work with the modem. Unless you change cables and
the modem cable isn't correct. Itay said check your cables.
You do know that the 850 modem cable isn't a 'standard' PC modem
cable? I think the FAQ has the pinouts of the 850.
also, OK you have an Intel modem, now I know.
The PC modem cable is usually 9 pin on one side, 25 on the modem side,
but the lines are different for the Atari 9/25 cable.
On the other hand, if you're using the same cable, with a null modem,
for the Amiga to A8 diskformer work, it should work with the modem.
Next week then. Good luck.

Have you tried using APE to connect your Atari 800 to your PC? It requires building a cable but then you are running games on your atari and just using your PC as a disk drive. I like being able to download atr files since some of my original disks are going bad.

4510. Transfering to PC

I have a good old XM301 and would like to know if it could be
possible to use it to transfer stuff to my PC which has its own modem.
I've tried connecting both modems directly with a phone cable and use
Amodem 7.5, but no such luck.

Is it possible to do it this way?

Thanks,
Lyv

Thanks. No jerky animation or anything ? I will have to try it them. Thanks again!

4513. Re: Ice T Questions

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-24 00:00:00 UTC
From: Russg <russg@en.com>
Message-ID: <397c4884$0$62234$53a6afc1@news.erinet.com>
Source record: 43280

Atari 8-bit vs PC 9 pin to 25 pin serial cables.
Comparison. You can check with ohm meter, two
people or a tiny clip helps. There are little
numbers next to the pins/holes. The A8 is
male9/male25. My PC serial is female9/male25.
A8/9end PC/9end PC25end(A8)
1. DTR CD.....pin 8(20)
2. CD RCV.....pin 3(8)
3. XMT XMT.....pin 2(2)
4. RCV DTR.....pin 20(3)
5. GND GND.....pin 7(7)
6. DSR DSR.....pin 6(6)
7. RTS RTS.....pin 4(4)
8. CTS CTS.....pin 5(5)
9. NC RI.....pin 22(NC)

If pin 1 of 9 goes to pin 8 of 25, it is a PC serial cable.
If pin 1 goes to pin 20, it is a A8 serial cable.
If pin 2 goes to 3, it is PC, 2 to 8, it is A8.
Pin 4 to 20, PC. Pin 4 to 3, A8.

Hi everyone!

I've been putting off announcing the BBS since I wanted to do some more work on it. But, I figure seeing some actual users will motivate me to develop it more :)

So, the "Atari Annex" BBS is now on-line and ready for users!

Just telnet to: atari.thebbs.org

Feel free to leave feedback -- I'm definitely looking for suggestions on improvement.

Thanks, Kevin!

I knew that you were in touch with Ron Fetzer and I actually went to the site before the announcement was made here and in comp.sys.atari.announce. What I saw pleased me greatly and I hope it gives others a chance to see a representation of disk-based user group newsletters. There were many of them, BTW, and I'm really happy that the OHAUG newsletters will survive the passing of the group.

I went away for a few days after seeing what you did, so the thanks are overdue. I was proud to be a part of OHAUG and two other Atari user groups at various times. Sadly, one bit the dust several years back, and it looks like OHAUG will do the same at the end of this year. The third one has converted to a PC user group and consists of members of LIAUG and OHAUG at present, so the feeling will not disappear very soon.

Take care.

Alan

4519. How to tell which Atari Basic Revision that you have

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-25 00:00:00 UTC
From: w_a_lang <w_a_lang@willinet.net>
Message-ID: <snseqs2s3j175@corp.supernews.com>
Source record: 43198
Cross-posted to: alt.atari,comp.sys.atari.8bit,comp.sys.atari.programmer

The memory address that identifies which Basic that you have is 43234.

So when you start your Atari up, at the READY prompt, type in this command:
PRINT PEEK (43234)

You will get a value of 162 if it is Rev A Basic.

You will get a value of 96 if it is Rev B Basic.

You will get a value of 234 if it is Rev C Basic.

Amateur Atari historian and Devout Atari game player,
Wally

4522. A cheat for Demon Attack

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-25 00:00:00 UTC
From: Russg <russg@en.com>
Message-ID: <397d1d37$0$61811$53a6afc1@news.erinet.com>
Source record: 43286

Demon Attack is a sorta Space Invaders game.
I found it on games disk 9 of Justin's archive.
It requires the translator on a real Atari 8.
It is only 4 k, but I found it fun.
I used Atari800 emulator, running 800 OSB, and running direct from
the emulator (not from the disk).
The cheat allowed me to play to 30,000. And I quit, 30,000 is far enough.
The cheat, on an emulator, is to change $B715 from D6 E5 10 to
EA 18 90. (all hex). With Atari800 you load the game. Then hit shift F8
to enter the monitor. type c b715 ea 18 90. then cont and play until
you start finding it repetitious. A neat little game I think.
Somebody was keeping a list of cheats. I forget who (Curt Vendel?).

Nolan's Nest & SPACE BBS Update
(763) 691-0626 300-19.2 Kbps
Open 24 Hours

File uploading and downloading is now fixed. Online games and movies for Atari callers
now available! I have temporarily taken the BBS off the phone line and now beta testing it on the Internet! The telnet address is 209.105.35.109. Any changes to the address this evening/early morning will be made here. Telnet will be available until about 7am at which time the BBS will be connected back to the phone line. I've tested it through Telnet and it works fine. The only thing to keep in mind when connecting is that you'll have to hit return several times to get the BBS to answer.
Keep trying....It should work. If it doesn't work, someone is probably on. You may email me as well if there are any problems. Any and all feedback, comments, and suggestions are welcome!

4524. FA: Four Player M.U.L.E. Machine!!

Newsgroup: comp.sys.atari.8bit

From: atarircx@my-deja.com
Message-ID: <8lk9qgmkd1@nnrp1.deja.com>
Source record: 43288

Hello,

To my knowledge the Atari 800 was the only stock computer platform that allowed four human player competitions of M.U.L.E. by Electronic Arts. There were some hacks on other platforms that allowed use of paddles and even the keyboard, but it was just not the same.

This week, I'm letting go a complete Atari 800 system including a mint copy of M.U.L.E.

You can check out all the details (and screenshots!) here:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=390629070

This system Includes:
* Atari 800 with 48K RAM (fully loaded!)
* 1050 enhanced density drive
* 410 Cassette drive
* AXIOM parallel printer interface
* 4 joysticks (for playing MULE!)
* Cartridge software: Pac-Man, Missile Command, Star Raiders, Atari Writer, Atari BASIC
* Boxed Disk software: MULE by Electronic Arts, Pinball Construction Set by Electronic Arts (Build your own pinball machine!)
* Two huge disk storage boxes containing hundreds of disks of Atari software (applications, utilities, DOSes, games, programming languages, graphics, music, and more... years of collecting Atari software)
* Books: COMPUTE!'s Mapping the Atari, 101 Programming Surprises and Tricks for The Atari (The Tiger Book!), Your Atari Computer, Atari BASIC a Self-teaching Guide.
* all power supplies and cables for the above

The game was originally for Atari ST in some Compute! Atari
magazine. It was in Modula-2. They ported it to 8-bit Atari,
"the Amiga from Commodore" (hehe), Commodore 64, and Apple II; all
in BASIC.

Then came "Advanced Laser Chess" and "Field of Dominion" both
from the same guy, both for the Amiga.

You can find a DOS version of Laser Chess from download.com.

You can also find a really bizzare clone of the game at
http://n.ethz.ch/student/pamberg/laser/index.html

You can also get OpenGL and non-OpenGL Windows versions of
both Laser Chess and Advanced Laser Chess from
http://www.laserchess.org

I did a Java version for the www.laserchess.org site
but it still isn't there!?!

That game was the best. The hard part is finding people
to play against. If anyone wants Xerox of code in the
original Compute! magazine let me know. You'll have to type
it in thou. I don't have the ST but do have the 8-bit Atari
code.

Can you tell me what issue of Compute! has the code for the
8-bit Atari Laser Chess??? I have a lot of issues of this
magazine, but knowing which it is in will help me find it.

Hi,

There was a company named Educational Software (or "Santa Cruz Educational Software", if memory serves me) that created several Tricky Tutorials, each on a different subject. These were quite fun to watch and were accompanied by an informative and entertaining manual.

A partial list:
#1 - Display Lists
#2 - Scrolling
#3 - Page Flipping
#4 - Basics of Animation
#5 - Player Missile Graphics
#6 - Sound and Music
#7 - Disk Utilities (not really a tutorial)

#9 - GTIA
#10 - Sound Effects

#12 - SAM (speech synthesis)

there were some more - up to #14, I think - and, other than 10 and 12, I have lost them all due to disk rot and a few careless mistakes. I really miss them.. Especially the adorable robot Proto..

I have seen no mention of these tutorials on the net. Does anyone have them, and are willing to email ATR images of them?

Thanks,

-itay

>Of course a better version of Ice-T and FT-80 would be nice.
>(especially flow control!)

Are you insinuating that you experience data loss in Ice-T, which was built from the ground up to NOT lost data EVER? How dare you! :)

Seriously now, Ice-T has a 16K data buffer, which means you shouldn't ever be losing data. How fast is your modem? How on earth can you overflow a 16K buffer in a VMS/Unix shell? I'm blowing the dust off Ice-T's sources, I might even do a few small modifications if they're easy enough..

I recall finding all of these games at a blow-out sale (carnival tent in huge parking lot) in the mid 80's for dirt cheap.

A few were interesting, but man were they buggy. Position the little guy in certain places and it was lock-up time. Frustrating. Reload game and do the whole thing over again (I can't recall whether there was a save feature).

If you want adventure-on-coarse-scrolling-graphics-zero-map, the Ultima series was much better.

Hi all! I know this isnt the correct newsgroup - but does anyone know where
I could find an Atari Jaguar in Australia?

Regards,

Anthony Beckett

4541. Re: last issue of ANALOG?

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-26 00:00:00 UTC
From: Russg <russg@en.com>
Message-ID: <397ee8c2$0$62233$53a6afc1@news.erinet.com>
Source record: 43208

A little history:
ANALOG published their first issue 1-2/81 (#1) and their last issue was 12/89 (#79). They were supposed to be bi-monthly at first, but were more like tri-monthly, taking 3 years to publish the first 14 issues. The months were not put on the cover of most of the first 14 issues. Then, beginning 1/84 (issue #15), they went monthly for 45 months until 10/87 (#58). There were 44 issues during that 45 month period. Then, from 10/87 to 3/88 there was a six month gap. LFP bought them and published monthly for 21 issues beginning 4/88 (#59) until the last issue #79 12/89. ANALOG then 'sold' or 'gave' their subscribers to Antic for an 'equivalent' number of remaining magazines. I'd like to know who now owns the rights to ANALOG.

Antic started 4/82 (Vol. 1 No. 1) and was bi-monthly for the first year, until Vol. 2 No. 1 (4/83), when they went monthly. Antic published monthly pretty regularly until 9/89 and went bi-monthly from 10-11/89 to 6-7/90 (Vol. 9 #2, last issue of separate Antic.) Antic was then put as a department in STart for four months and then STart published their last two combined ST and 8-bit magazines 2-3/91 and 4-5/91, which was the last issue of both Antic and STart. There were about 94 Antics, including the Antic section of STarts.

Source record: 43209

Since nobody seems to be answering, I'll try.
I believe it is possible, but not a very good solution.
There is a xm301 handler that will let you run 850 Express, BobTerm
or maybe even Ice-T.
Maybe it would work even with your Amodem 7.2. Can you talk
to the XM-301? I mean type AT enter and get a OK back?
If so, then you would type ATO enter and go to pc and type
ATA enter. Seems like Rick Cortese knows a way to do modem
to modem connections.
You'd be much better off with a SIO2PC/APE cable or even a
null modem setup. But then you'd need a 850 or PRC serial interface.
For sure, you could use Procomm, the old Procomm on the PC (2.4.3?).
and two phone lines and BobTerm on the A8 side, with the Dillow
xm301 handler.

4545. Using control codes with Pine on my 800XL?

Newsgroup: comp.sys.atari.8bit
Date: 2000-07-26 00:00:00 UTC
From: Jake <root@org.net.com>
Message-ID: <397f04ed$0$61819$736eb2f4@news.raex.com>
Source record: 43212

I can access the net with my 800XL and a 1030 modem via a shell account using AMODEM 4.2, but I can't seem to get the control codes to work in Pine or Lynx (if I use the control key on the 800XL in combination with the correct "letter" key [eg, Control C], nothing happens. Also, the return key doesn't work correctly, either; I have to use CONTROL J [or maybe CONTROL M]). I have BobTerm, but I haven't transferred it from the PC yet.

Should I use a different terminal program or is there some other way to use Pine and Lynx with the 800XL and AMODEM.

Thanks

Hello Larry,

As I told you in email, I'm bringing up the subject at a meeting next week.

All of the library is p/d, shareware or freeware, so permission to duplicate is not a problem. Getting someone to do it is. As you know, our librarian passed away a few months ago, and although we've had someone volunteer to handle the library, he's a very busy guy, so who knows.

A bigger problem is doing the research to decide what's unique and what's already on the Web, should we want to pull out what's there.

Since the library has some 700 disks, with duplication of programs on some of them, it might take well past the five months or so we have until we fold.

I should have some news later this week about it.

Take care.

Bill,

I KNOW THIS IS OFF TOPIC!

But as an Atarian, perhaps you can give me an honest answer.

Whenever Linux newbies ask experienced users of Linux how to accomplish some customization, the answer is always, "Recompile the kernel." That seems a bit drastic to me and most of my friends. Is the secret of Linux's stability the fact that a kernel recompile is almost always necessary for any customization?

Seems to me that the same version and distribution of Linux, running on two different machines, is almost two different OSs (not to mention different distributions of the same version.)

Ah, for the simplicity of an Atari 8-bit!

I think there are more reasons for compiling a machine specific kernal then
just customizing it.

I am just getting back into Linux<Redhat 6.2> after a long layoff, I think
the last version I used before I dropped out was 1.21 or so. But back then I
believe a lot of hardware support and processor specific code was built into
the kernal at compile time. If you had a kernal that supported scsi for
instance on a system w/o a scsi controller it would look for it every boot.
By doing a machine specific compile, you end up with the smallest possible
kernal and the fastest boot.

My oldest son does it for a living now. ~10 years ago I dragged him kicking
and screaming into trying Linux, now he is dragging me kicking and screaming
back into it. If you have a specific question I will pass it to him.

He is mostly a Windows/Windows NT guy, but he is a net admin so he has to do
a lot of Linux type boxes so he has something less bug ridden, doesn't have
more holes then a sieve, and doesn't need to be rebooted hourly. I think he
may be moving to BSD pretty soon as that provides even better security, but
if we catch him now he may have a few answers.

His solution to doing a recompile everytime he does an install is to use
standard equipment like 3COM network cards on every machine, everyone gets
the same video card, etcetera.

I thought it worked in ASCII mode, but anyway.

You should be able to look up the equivalent Atari keys and send them.

For example, to send a CR/line feed, hit; ESC<ctr>M. ESC<ctrl>J

Ditto for typing special characters that aren't on an Atari, a semicolon ';'
is something like ESC<shift><clear> and may look like an little arrow on the
Atari screen.

I think I used Express and other then not having 80 columns, everything
worked fine. SpeedScript also has a standard ASCII character set built in,
so it displays any downloaded text with characters like the semicolon
correctly.

> any customization?

It is fairly drastic, though if your original kernel is build with
drivers compiled in, you'll have to recompile when you change
hardware. If you compile your kernel as much as possible/reasonable
with modules, you won't need to reboot much- and will recompile even
less frequently.

It also depends on the customization; if you're trying to bring up a
USB gizmo and don't have any USB support in the kernel, you have to
rebuild it. But, if you already have pcmcia running, and get a new
pcmcia modem, you almost certainly won't have to rebuild.

The only times I've had to recompile the kernel was when adding
hardware that wasn't supported in the default kernel's compile and
localizing a kernel to the particular chipset/processor it was to run
on.

> Seems to me that the same version and distribution of Linux, running on two
> different machines, is almost two different OSs (not to mention different
> distributions of the same version.)

Not necessarily, I maintain a Mac G3 server running a Debian distro
for the PowerPC and my Debian based desktop Intel box. Once you get
outside the detailed hardware driver stuff in the kernel, its pretty
much identical between the 2. Actually, despite the detailed driver
stuff, the bulk of the kernel config & module stuff is nearly
identical. At the user level, with software that isn't directly
exploiting hardware, the difference is essentially imperceptible.

> Ah, for the simplicity of an Atari 8-bit!

Say it brother!

I already knew this page. The game isn't there. There's "crumbles
crisis", "swamp chomp" & "chomper", but no "crush, crumble & chomp".
Maybe it's there under another name?

Or could you be so kind and upload it, too?

Try sending the command to the modem to disable hardware flow control.

With many modems this is AT&K0

You will have to enter it blindly, but if its the problem you will see 'OK' when
you press ENTER.

Open the drive =) But seriously, if the 1050 can be sucessfully
configured for double density and a disk formatted that way, then you
have a modified drive.

Which modification you have is another thing. The US Doubler and
its various clones only add a few features to the drive: true double density
and the ability to format disks w/ the sectors laid out in different orders.

If you have a 'Happy' drive you can tell by loading up the Happy
software. It will load on any drive but it will show at the menu which drives
have a 'Happy' enhancement.

I'm not sure how you would identify an Archiver enhanced drive
without opening it. The 810 version requires a special 'open code' to
make the Archiver come alive, the 1050 version may have the same
feature.

This could be almost anything. Check the regulator voltages
first, then try swapping the RAM and FDC in that order. Covers about
90% of these problems.

Actually, I'm currently working on my own port of Atari800 to Windows
(which is basically the DOS version in a window) and have made the a8
based monitor part of the project. The current emulator assumes that
everyone is running it from a console.

If anyone has any suggestions on an interface for the monitor, please
let me know. I'm currently going to try and replicate the screen the
Black Box monitor provides. Hopefully, the Atari800 guys will find it
useful enough to include in the main distribution :)

I'm also working on MUX emulation and R: dial-out via telnet. If anyone
can provide me more information on the MUX than the documentation on
CSS's site, let me know.

Yes, but lets remember that Rich does this emu for FREE and his time earns
him his wages, 1st and foremost. Hopefully Rich will have the time at some
point but I'd rather the time he spends is on making the emulation better
and better.

This begs the question:

Would anyone be interested in a new 8-bit emulator for Windows? A friend and I have written one that is at least up to the level of Atari800Win in all areas, and well beyond it in many ways. We aren't 100% satisfied with the sound yet, and haven't had the time to finish it up. It does have a built in (Windows-based) monitor/debugger. The monitor/debugger still needs some additional features, but it handles most fo the common debugger type stuff including breaking, single stepping, disassembly, ATASCII display of memory, live register display, etc.

We also have a bit more testing to do, since this emulator was written from the ground up, not using any existing parts. We also need to do some work to handle XEGS ROMs, and adding ROM patches to some of the less-common ROM versions.

Hmm, when I play on my 800XL and turn on sheilds, screen goes green I think.
I'll have to check.

Haven't tried it on the emulator nad haven't played it for real for a while
...

(Only problem is, if I fire it up I'll never put it down - what a game !!!)

Competition is a good thing. I look forward to seeing this, especially
if your claim of surpassing Atari800Win is true.

Nope, they are definitely blue. The manual even states that they are
blue. Patrick is right; Star Raiders doesn't look correct on any
current emulator. I wonder why that is; what's special about SR's
display that causes this? Artifact settings wouldn't affect it, since
SR seems to use graphics mode 7, but most other mode 7 games look fine.

I'm sorry. As much as I respect and admire Atari800Win for its superb emulation - the best I have ever seen - Why are newer versions not as good as earlier ones?

Version 2.5c was the best released. It really worked.

The new version introduces horrible, loud CLICK CLICK CLICK noises whenever the PC runs the emulation at anything less than 100% speed. (Otherwise, the sound seems the same, except for a somewhat hollow keyclick). The Break key has stopped working. Half my games suddenly won't load using the "Load EXE/COM" function (a bug inherited from the Atari800 code base binary loader.. so why use it?).

While the new version is ok for checking out, I am staying with the old for now.

Why don't you use a real 80-column VT-100 emulator? They should work fine
with shell accounts.

Try FlickerTerm80, Ice-T, Omnicom, Kermit-65.

Thanks, great info. Does anyone know where the original publishers of
Analog an Antic are now? Didn't Antic try to break into the Mac
publishing arena and also some sort of family computing magazine?

A slight correction is in order: Clint Parker is Action! fame; Bill was
the OSS guru (plus Atari BASIC and DOS).

Yeah, thanx. I got it now. Here's the story, why I didn't get it in the
first place:

I use Netscrap 4.5 and when following the link you gave, I found nothing
but a blank screen. I then checked the source of the page and found some
writings about a "main.html" so I tried:
http://www.atariworld.com/8bit/main.html
and followed the link displayed there and got to "Holmes Atari 8bit
Games" and there is no sight of the game. With your last post I checked
again and found that the page you're refering to is in fact located
here:
http://www.atariworld.com/8bit/contents.html

Hope that proves that I'm not blind :-)

Thanx again,
Manuel
